Warnings and Notices

Note that warnings and notices appear at appropriate intervals throughout this manual. Warnings are provided to alert installing contractors to potential hazards that could result in personal injury or death. Cautions are designed to alert personnel to hazardous situations that could result in personal injury, while notices indicate a situation that could result in equipment or property-damage-only accidents.

Your personal safety and the proper operation of this machine depend upon the strict observance of these precautions.

ATTENTION: Warnings, Cautions and Notices appear at appropriate sections throughout this literature. Read these carefully.

WARNING: Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION: Indicates a potentially hazardous situation which, if not avoided, could result in minor or moderate injury. It could also be used to alert against unsafe practices.

NOTICE: Indicates a situation that could result in equipment or property-damage only accidents.

NOTICE: Environmental Concerns!

Scientific research has shown that certain man-made chemicals can affect the earth's naturally occurring stratospheric ozone layer when released to the atmosphere. In particular, several of the identified chemicals that may affect the ozone layer are refrigerants that contain Chlorine, Fluorine and Carbon (CFCs) and those containing Hydrogen, Chlorine, Fluorine and Carbon (HCFCs). Not all refrigerants containing these compounds have the same potential impact to the environment. Trane advocates the responsible handling of all refrigerants-including industry replacements for CFCs such as HCFCs and HFCs.

NOTICE: Responsible Refrigerant Practices!

Trane believes that responsible refrigerant practices are important to the environment, our customers, and the air conditioning industry. All technicians who handle refrigerants must be certified. The Federal Clean Air Act (Section 608) sets forth the requirements for handling, reclaiming, recovering and recycling of certain refrigerants and the equipment that is used in these service procedures. In addition, some states or municipalities may have additional requirements that must also be adhered to for responsible management of refrigerants. Know the applicable laws and follow them.

⚠ WARNING: Refrigerant Warning Information!

Trane Model CGAM chillers use R-410A refrigerant which is a high-pressure refrigerant and requires careful attention to proper storage and handling procedures.

Use only manifold gauge sets designed for use with R-410A refrigerant. Use only refrigerant recovery units and cylinders designed for the higher pressures of R-410A refrigerant and POE oil.

R-410A must only be charged into the unit in a liquid state!

R-410A refrigerant must be stored in a clean, dry area out of sunlight. Never heat or allow refrigerant storage cylinder temperatures to reach 125°F or store the cylinders where temperatures will exceed 125°F. Keep cylinder valves tightly closed and valve caps in place when refrigerant cylinders are not in use.

⚠ WARNING: Personal Protective Equipment (PPE) Required!

Always refer to appropriate MSDS and OSHA guidelines when handling refrigerants. Use proper breathing, eye and body protection when handling refrigerants. Failure to follow proper handling guidelines could result in serious injury or death.

⚠ WARNING: Live Electrical Components

During installation, testing, servicing and troubleshooting of this product it may be necessary to work with live electrical components. Have a qualified, licensed electrician or other person who has been properly trained in working with live electrical components perform these tasks. Failure to follow all electrical safety precautions when exposed to live electrical components could result in serious injury or death.

Table of Contents

Model Number Description

Overview

This manual covers the installation, operation and maintenance of the CGAM units.

Nameplates

The CGAM unit nameplates are applied to the exterior surface of the control panel door for 20-70 Ton sizes. The 80-120 Ton sizes have a nameplate on a support beam to the right side of the starter panel.

A compressor nameplate is located on each compressor.

Unit Nameplate

The unit nameplate provides the following information:

- Unit model and size descriptor.
- Unit serial number.
- Identifies unit electrical requirements.
- Lists correct operating charges of R-410A and refrigerant oil.
- Lists unit design pressures.
- Identifies installation, operation and maintenance and service data literature.
- Lists drawing numbers for unit wiring diagrams.

Compressor Nameplate

The compressor nameplate provides the following information:

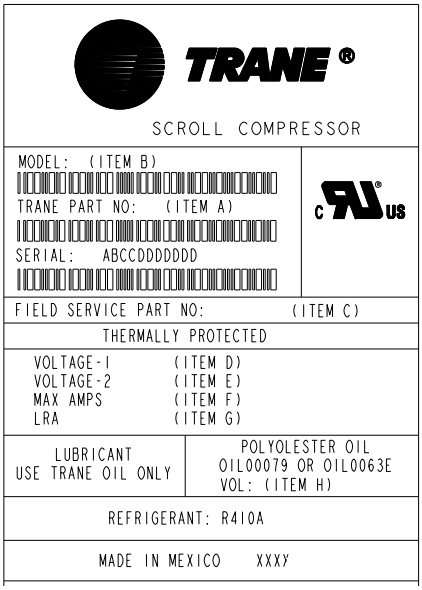
- Compressor model number.
- Compressor serial number.
- Compressor electrical characteristics.
- Utilization Range.
- Recommended refrigerant.

Model Number Coding System

The model numbers for the unit and the compressors are comprised of numbers and letter which represent features of the equipment.

Each position, or group of positions, in the number is used to represent a feature. For example, Unit Voltage, contains the number “F”. From the chart, it can be seen that a “F” in this position means that the unit voltage is 460/60/3.

Figure 2. CGAM Compressor Nameplate



Compressor Model Number

The compressor model number is located on the compressor nameplates.

M - Suction & Discharge Tube, oil equalizer with seal nut, Grade 32 POE oil

General Information

Unit Description

The CGAM units are scroll type, air-cooled, liquid chillers, designed for installation outdoors. The 20-35 ton units have a single independent refrigerant circuit, with two compressors per circuit. The 40 ton and larger units have 2 independent refrigerant circuits, with two compressors per circuit. The CGAM units are packaged with an evaporator and condenser.

Note: Each CGAM unit is a completely assembled, hermetic package that is factory-piped, wired, leak-tested, dehydrated, charged and tested for proper control operations prior to shipment. The chilled water inlet and outlet openings are covered for shipment.

The CGAM series features Trane's exclusive Adaptive Control logic with CH530 controls. It monitors the control variables that govern the operation of the chiller unit. Adaptive Control logic can correct these variables, when necessary, to optimize operational efficiencies, avoid chiller shutdown, and keep producing chilled water.

Each refrigerant circuit is provided with filter, sight glass, electronic expansion valve, and charging valves on the CGAM.

The evaporator is a brazed plate heat exchanger which is equipped with a water drain and vent connections in the water piping.The condenser is an air-cooled slit fin coil.

The condensers are available in three configurations depending on the tonnage of the unit. Units may be referred to the size by the condenser configuration. The three configurations are slant, V and W.

Figure 3. CGAM Slant 20-35 Ton Configuration

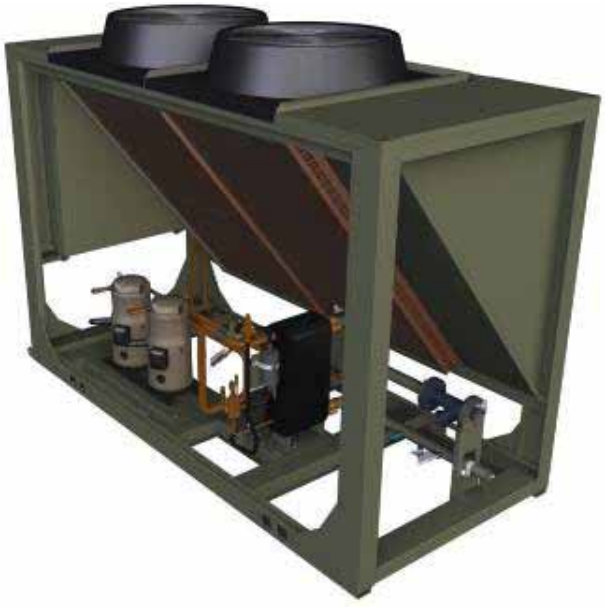

Figure 4. CGAM “V” 40-70 Ton Configuration

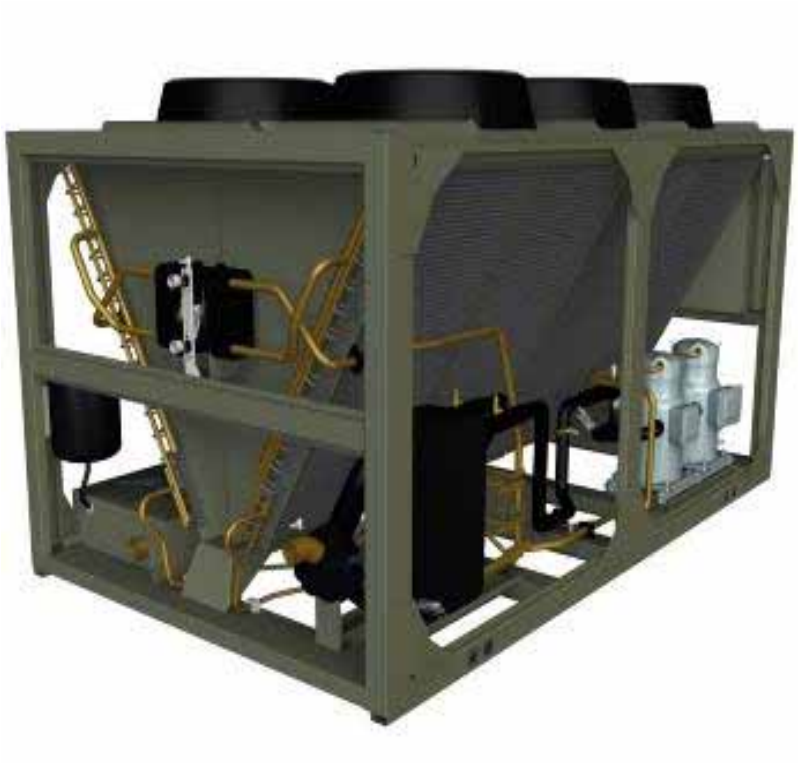

Figure 5. CGAM “W” 80-120 Ton Configuration

Accessory/Options Information

Check all the accessories and loose parts which are shipped with the unit against the original order. Included in these items will be water vessel drain plugs, rigging diagrams, electrical diagrams, and service literature, which are placed inside the control panel and/or starter panel for shipment. Also check for optional components, such as isolators.

The unit isolators and fan prop rod ship on brackets attached to the frame of the unit. The location varies by unit tonnage. The following figures show the location of these ship with items for the different sizes.

Figure 6. Slant 20 -35 Ton - Ship with Location - Isolator and Prop Rod

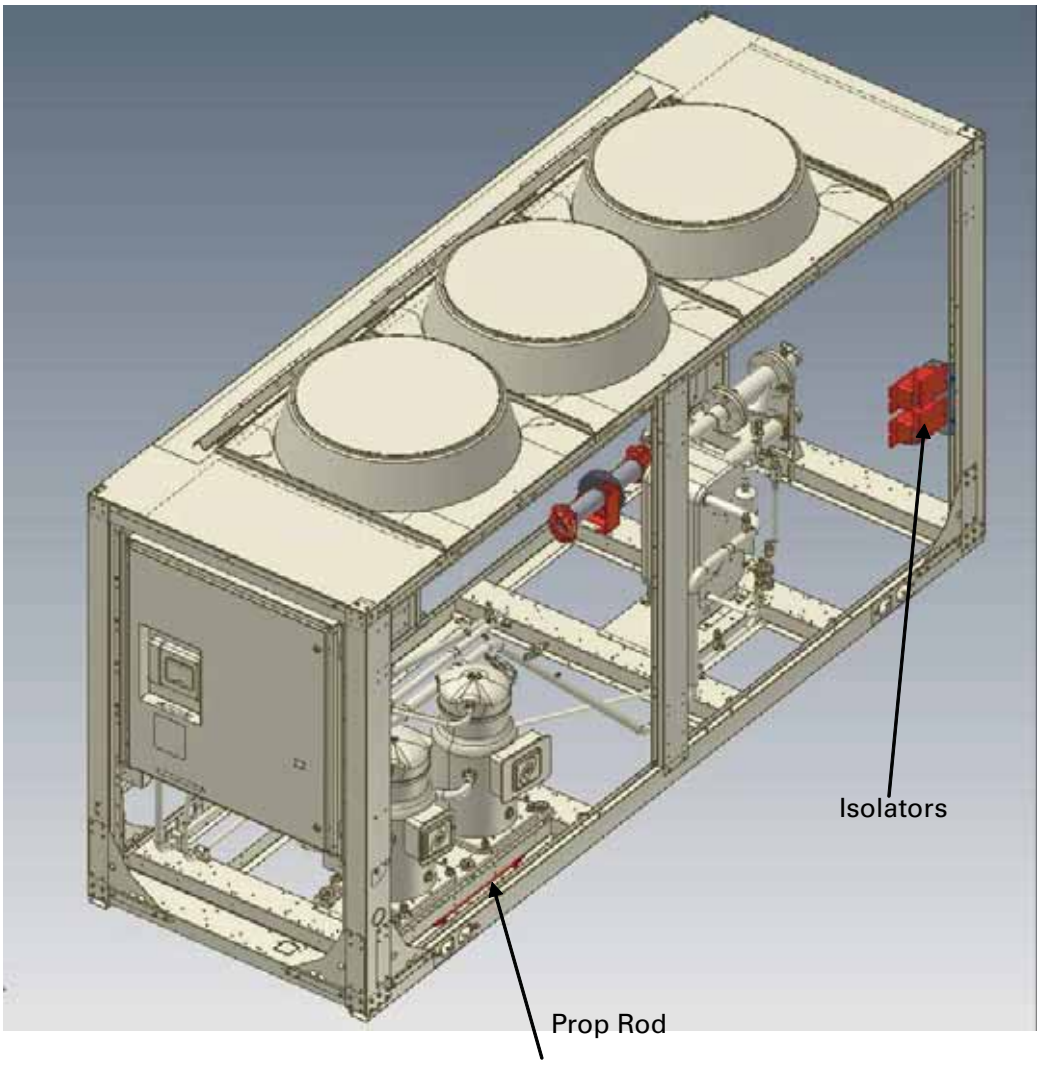

Figure 7. V 40-70 Ton - Ship with Location - Isolators and Prop Rod

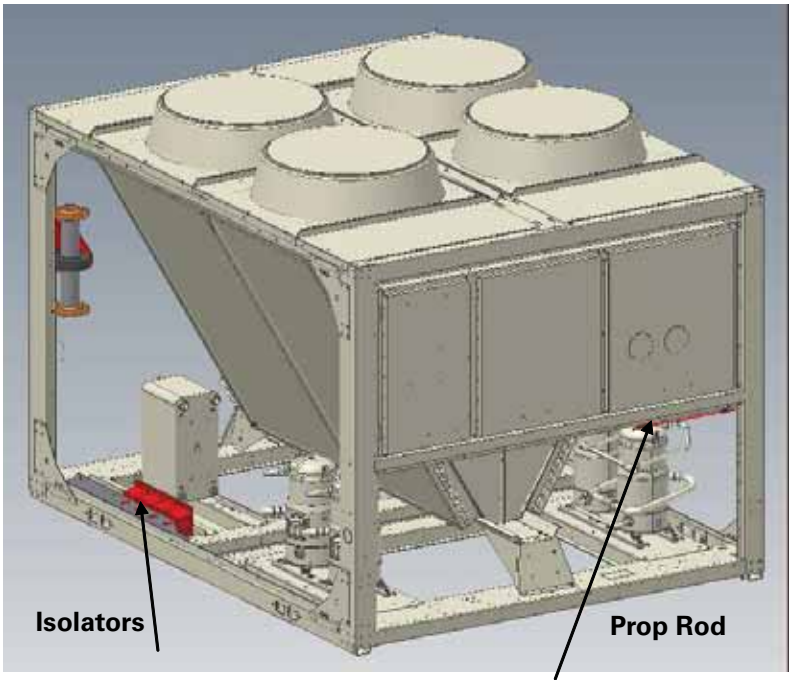

Figure 8. W 80-120 Ton - Ship with Location - Isolators and Prop Rod

2. Flow limits are for water only.

Pre-Installation

Inspection Checklist

When the unit is delivered, verify that it is the correct unit and that it is properly equipped. Compare the information which appears on the unit nameplate with the ordering and submittal information.

Inspect all exterior components for visible damage. Report any apparent damage or material shortage to the carrier and make a “unit damage” notation on the carrier's delivery receipt. Specify the extent and type of damage found and notify the appropriate Trane Sales Office.

Do not proceed with installation of a damaged unit without sales office approval.

To protect against loss due to damage incurred in transit, complete the following checklist upon receipt of the unit.

- Inspect the individual pieces of the shipment before accepting the unit. Check for obvious damage to the unit or packing material.
- Inspect the unit for concealed damage as soon as possible after delivery and before it is stored. Concealed damage must be reported within 15 days.
- If concealed damage is discovered, stop unpacking the shipment. Do not remove damaged material from the receiving location. Take photos of the damage, if possible. The owner must provide reasonable evidence that the damage did not occur after delivery.
- Notify the carrier's terminal of the damage immediately, by phone and by mail. Request an immediate, joint inspection of the damage with the carrier and the consignee.
- Notify the Trane sales representative and arrange for repair. Do not repair the unit, however, until damage is inspected by the carrier's representative.

Unit Storage

If the chiller is to be stored in ambients of 32°F or less, evaporator should be blown out to remove any liquid and refrigerant isolation valves should be closed.

If the chiller is to be stored for more than one month prior to installation, observe the following precautions:

- Do not remove the protective coverings from the electrical panel.
- Store the chiller in a dry, vibration-free, secure area.
- Units charged with refrigerant should not be stored where temperatures exceed 155°F.
- At least every three months, attach a gauge and manually check the pressure in the refrigerant circuit. If the refrigerant pressure is below 200 psig at 70 F (or 145 psig at 50 F), call a qualified service organization and the appropriate Trane sales office.

Note: Pressure will be approximately 20 psig if shipped with the optional nitrogen charge.

Installation Requirements

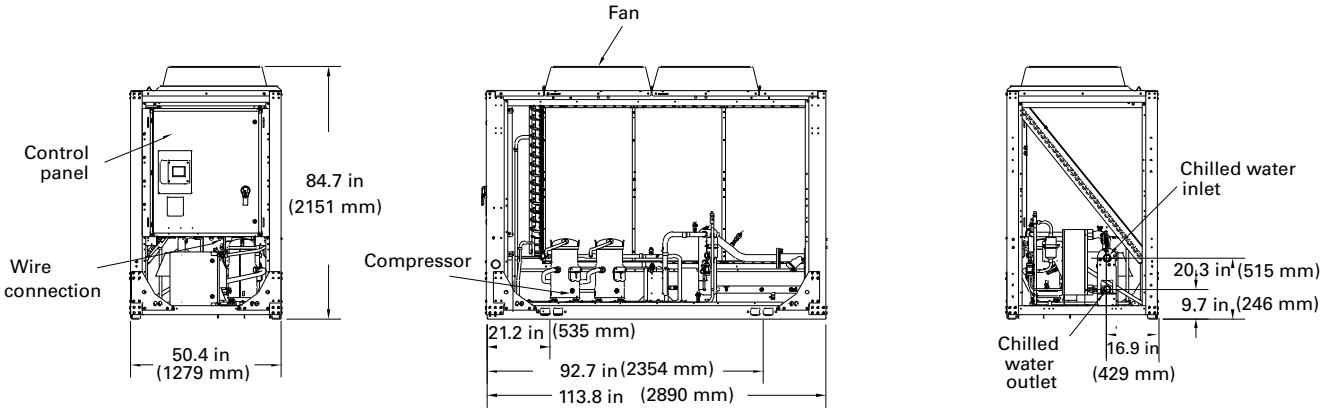
A list of the contractor responsibilities typically associated with the unit installation process is provided.

Type of Requirement	Trane Supplied Trane Installed	Trane Supplied Field Installed	Field Supplied Field Installed
Foundation			• Meet foundation requirements
Rigging			• Safety chains • Clevis connectors • Lifting beam
Isolation		• Elastomeric isolators (optional)	• Elastomeric isolators (optional)
Electrical	• Circuit breakers (optional) • Unit mounted starter		• Circuit breakers (optional) • Electrical connections to unit mounted starter • Wiring sizes per submittal and NEC • Terminal lugs • Ground connection(s) • BAS wiring (optional) • Control voltage wiring • Chilled water pump contactor and wiring including interlock • Option relays and wiring
Water piping	• Flow switch • Water strainer		• Taps for thermometers and gauges • Thermometers • Water flow pressure gauges • Isolation and balancing valves in water piping • Vents and drain • Pressure relief valves
Insulation	• Insulation • High humidity insulation (optional)		• Insulation
Water Piping Connection Components	• Grooved pipe		
Other Materials	• R-410A refrigerant (1 lb. maximum per machine as needed) • Dry nitrogen (20 psig maximum per machine as needed)		

Unit Dimensions/Weights

Dimensions

Figure 9. CGAM 20 and 26 ton - no options



Water connections are 1.7 in (44 mm) from the end.

Installation - Mechanical

Location Requirements

Sound Considerations

- Refer to *Trane Engineering Bulletin Chiller Sound Ratings and Installation Guide* CG-PRB010-EN for sound consideration applications.
- Locate the unit away from sound-sensitive areas.
- Install the optional elastomeric isolators under the unit. Refer to "Unit Isolation."
- Chilled water piping should not be supported by chiller frame.
- Install rubber vibration isolators in all water piping.
- Seal all wall penetrations.

Note: Consult an acoustical engineer for critical applications.

Foundation

Provide rigid, non-warping mounting pads or a concrete foundation of sufficient strength and mass to support the applicable operating weight (i.e., including completed piping, and full operating charges of refrigerant, oil and water). Refer to the chapter on "Unit Dimensions/Weights" for unit operating weights. Once in place, the unit must be level within 1/4" (6.4 mm) over its length and width. The Trane Company is not responsible for equipment problems resulting from an improperly designed or constructed foundation.

Clearances

Provide enough space around the unit to allow the installation and maintenance personnel unrestricted access to all service points. Refer to submittal drawings for the unit dimensions, to provide sufficient clearance for the opening of control panel doors and unit service. Refer to the chapter on "Unit Dimensions/Weights" for minimum clearances. In all cases, local codes which require additional clearances will take precedence over these recommendations.

Rigging

Refer to Unit Dimensions/Weights section for typical unit lifting weights. Refer to the rigging label attached to the unit for further details.

Lifting Procedure

Attach chains or cables to lifting beam, as shown in the following figures. Lifting beam crossbars **MUST** be positioned so lifting cables do not contact the sides of the unit. Adjust as necessary for even level lift.

Unit Isolation and Leveling

Mounting

Construct an isolated concrete pad for the unit or provide concrete footings at each of the four unit mounting points. Mount the unit directly to the concrete pads or footings.

Level the unit using the base rail as a reference. The unit must be level within 1/4” over the entire length. Use shims as necessary to level the unit.

Elastomeric Isolator Installation (optional)

Install the optional neoprene isolators at each mounting location. Isolators are identified by part number and color.

1. Secure the isolators to the mounting surface, using the mounting slots in the isolator base plate, as shown in Figure 26. Do not fully tighten the isolator mounting bolts at this time.
2. Align the mounting holes in the base of the unit, with the threaded positioning pins on the top of the isolators.
3. Lower the unit on to the isolators and secure the isolator to the unit with a nut. Maximum isolator deflection should be approximately 1/4”.
4. Level the unit carefully. Refer to “Leveling”. Fully tighten the isolator mounting bolts.

Evaporator Piping

Evaporator water connections are grooved.

Thoroughly flush all water piping to the CGAM unit before making the final piping connections to the unit.

Components and layout will vary slightly, depending on the location of connections and the water source.

⚠ CAUTION

Equipment Damage!

If using an acidic commercial flushing solution, construct a temporary bypass around the unit to prevent damage to internal components of the evaporator and the pump.

⚠ CAUTION

Proper Water Treatment!

The use of untreated or improperly treated water in a Chiller may result in scaling, erosion, corrosion, algae or slime. It is recommended that the services of a qualified water treatment specialist be engaged to determine what water treatment, if any, is required. Trane assumes no responsibility for equipment failures which result from untreated or improperly treated water, or saline or brackish water.

Drainage

Locate the unit near a large capacity drain for water vessel drain-down during shutdown or repair. Evaporators are provided with drain connections. Refer to "Water Piping." All local and national codes apply.

A vent is provided on the top of the evaporator at the chilled water inlet. Be sure to provide additional vents at high points in the piping to bleed air from the chilled water system. Install necessary pressure gauges to monitor the entering and leaving chilled water pressures.

Provide shutoff valves in lines to the gauges to isolate them from the system when they are not in use. Use rubber vibration eliminators to prevent vibration transmission through the water lines.

If desired, install thermometers in the lines to monitor entering and leaving water temperatures. Install a balancing valve in the leaving water line to control water flow balance. Install shutoff valves on both the entering and leaving water lines so that the evaporator can be isolated for service.

Evaporator Piping Components

Piping components include all devices and controls used to provide proper water system operation and unit operating safety. These components are listed below.

Entering Chilled Water Piping

- Air vents (to bleed air from system)
- Water pressure gauges with shutoff valves
- Vibration eliminators
- Shutoff (isolation) valves
- Thermometers (if desired)
- Relief valve

Leaving Chilled Water Piping

- Air vents (to bleed air from system)
- Water pressure gauges with shutoff valves
- Vibration eliminators
- Shutoff (isolation) valves
- Thermometers (if desired)
- Balancing valve

NOTICE
Water Damage!

Standard pressure is 72.5 Psig for all factory installed components on the suction side of water pump. Standard pressure of components on the discharge side of water pump is 145 Psig. You MUST drain the system FIRST before releasing the pressure. Failure to do so could result in water spray which could cause equipment and/or property damage.

Water Strainer

The water strainer is factory-installed with taps for the pressure gauges on the inlet and outlet.

Install pressure gauges in order to measure differential pressure across the filter. This will help to determine when it is necessary to clean the water strainer.

Flow Switch

The flow switch is factory-installed and programmed based on the operating conditions submitted with the order. The leaving evaporator temperature, fluid type and fluid concentration affect the selected flow switch. If the operating conditions on the job site change, the flow switch may need to be replaced.

Figure 28. Total Unit Pressure Drop Curves (60Hz)

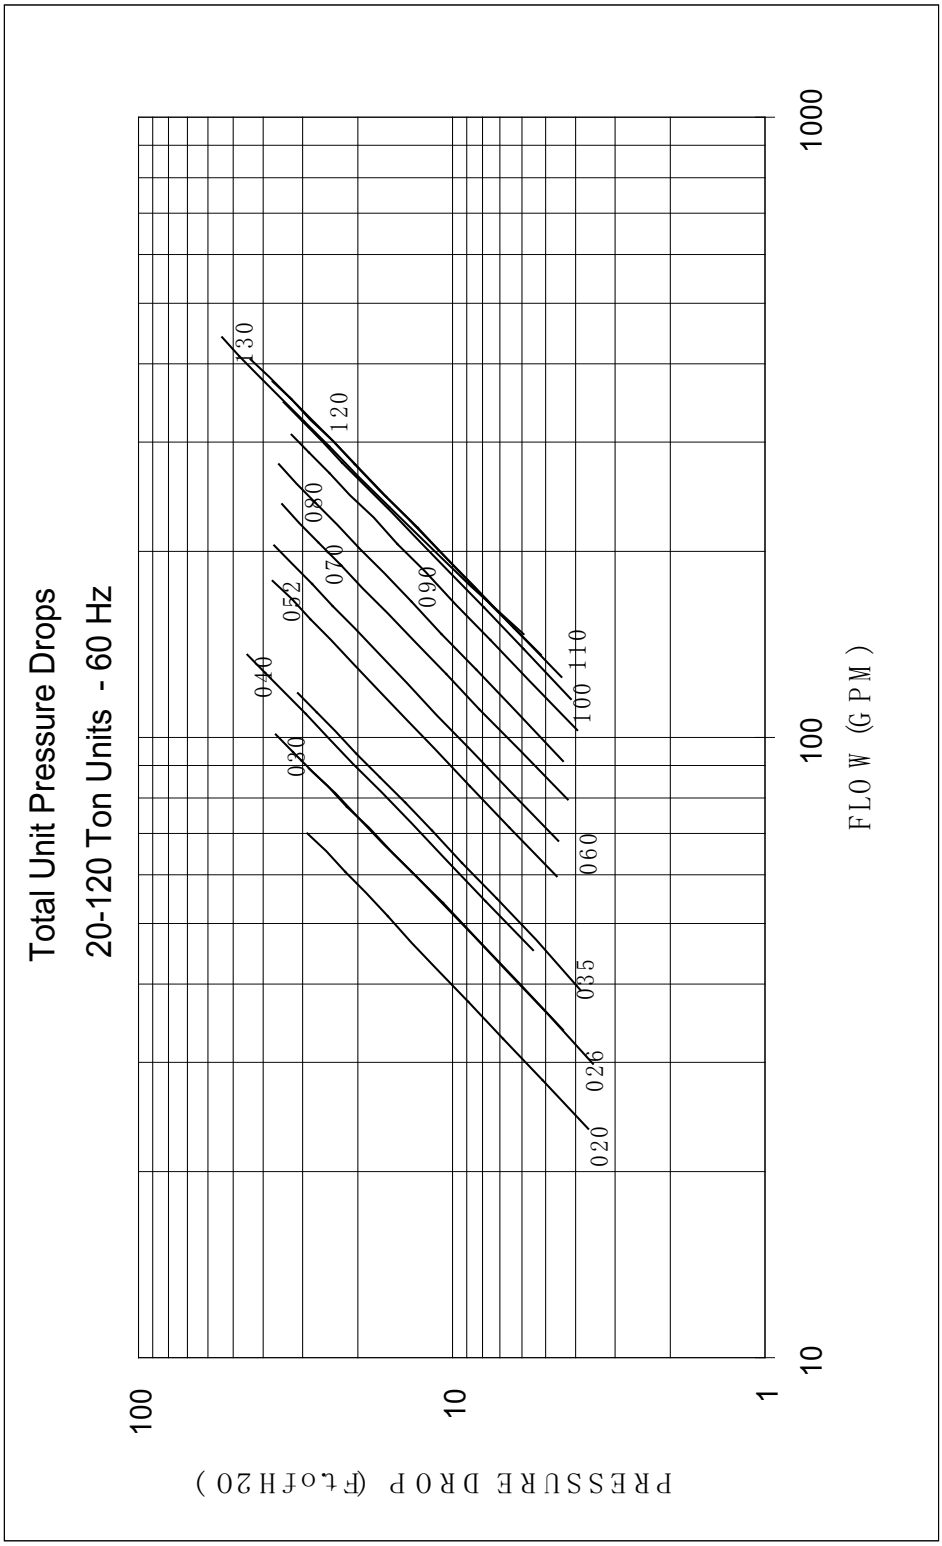

Figure 29. Total Unit Pressure Drop Curves (50 Hz)

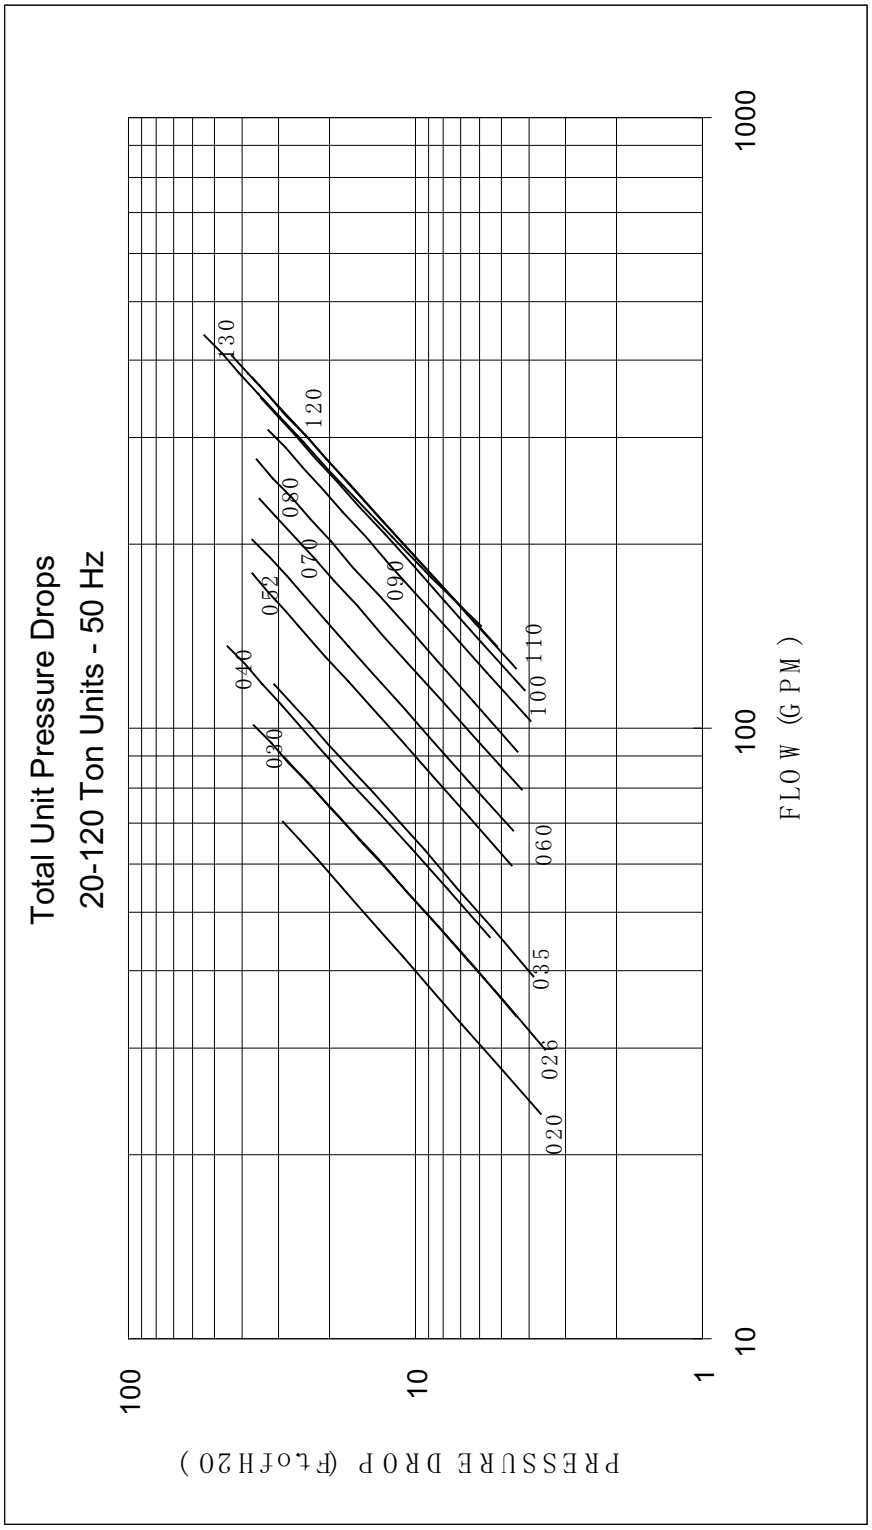

Freeze Protection

Depending on the ambient temperature the unit may be exposed to there are up to four different options for freeze protection. They are listed in order of highest ambient (least freeze protection) to lowest ambient (most freeze protection).

1. Water pump (for protection with ambient temperatures down to 0°F)
   a. CH530 controller can start the pump when the ambient temperatures drops to prevent freezing. For this option the pump must to be controlled by the CGAM unit and this function must be validated.
   b. Water circuit valves need to stay open at all times.

OR

2. Heaters (for protection with ambient temperatures down to -20°F)
   a. Heaters are factory-installed on the evaporator and water piping and will protect them from freezing in ambient temperatures down to -20°F (-29°C).
   b. Install heat tape on all water piping, pumps, and other components that may be damaged if exposed to freezing temperatures. Heat tape must be designed for low ambient temperature applications. Heat tape selection should be based on the lowest expected ambient temperature.

OR

3. Freeze inhibitor with heaters
   a. For protection with ambient temperatures **down to -20°F**:
      i. Add a freeze inhibitor fluid to the chilled water system. The solution must be strong enough to provide protection against ice formation at the lowest anticipated ambient temperature.
      ii. Activate the heaters and heat tape on the unit.
   b. For protection with ambient temperatures **below -20°F**:
      i. Add a freeze inhibitor fluid sufficient for burst protection at the lowest anticipated ambient temperature.
      ii. Activate the heaters and heat tape on the unit.

   Note: Use of a freeze inhibitor fluid reduces the cooling capacity of the unit and must be considered in the design of the system specifications.

OR

4. Drain water circuit (for protection with ambients below -20°F)
   a. Shut off the power supply to the unit and to all heaters.
   b. Purge the water circuit.
   c. Blow out the evaporator to ensure no liquid is left in the evaporator.

Note: By default the CH530 freeze protection control is enabled and will request the start of the chilled water pump with ambient temperatures at or below freezing. If you do NOT want the CH530 to start the pump when the ambient temperature drops to freezing, disable this freeze protection control.

NOTICE

Equipment Damage!

All heaters have separate power from the unit. All heaters must be energized when the unit is off (unless the water circuit is drained). In the event of power loss heaters will not protect the evaporator from catastrophic damage. In order to provide freeze protection in the event of a power loss you MUST drain the evaporator or use sufficient freeze inhibitor in the evaporator.

Low Evap Refrigerant Cutout/Percent Glycol Recommendations

The table below shows the low evaporator temperature cutout for different glycol levels.

Additional glycol beyond the recommendations will adversely effect unit performance. The unit efficiency will be reduced and the saturated evaporator temperature will be reduced. For some operating conditions this effect can be significant.

If additional glycol is used, then use the actual percent glycol to establish the low refrigerant cutout setpoint.

Table 12. Low Evap Refrigerant Temp Cutout and Low Water Temp Cutout

ETHYLENE GLYCOL							PROPYLENE GLYCOL						
% Glycol	Solution Freeze Point [F]	Low Refrig Temp Cutout [F]	Low Water Temp Cutout [F]	Min Chilled Water Set Point [F] Number of compressors			% Glycol	Solution Freeze Point [F]	Low Refrig Temp Cutout [F]	Low Water Temp Cutout [F]	Min Chilled Water Set Point [F] Number of compressors

Partial Heat Recovery

The partial heat recovery is comprised of an auxiliary heat exchanger installed in the discharge line between the compressor and the air -cooled condenser. The heat exchanger cools compressor discharge gas and rejects the energy to a separate water loop for hot water applications. The chiller can simultaneously produce chilled and hot water.

The heating capacity is driven by the cooling demand on the chiller, the condensing temperature and the flow rate through the heat exchanger.

The partial heat recovery includes:

- Brazed plate heat exchanger
  - Units 20-35 Tons have a single braze plate heat exchanger. Units 40-120 Tons have two braze plate heat exchangers in parallel arrangement.
- Piping between the heat exchanger(s)
- Insulation of the heat exchanger(s) and water pipe
- Two temperature sensors to read the inlet/outlet hot water temperature information on the unit control display
- Heater on partial heat recovery heat exchanger(s) and water pipe
- Manual air vent
- Drain pipe

Water circulating inside the heat recovery heat exchanger should never be used for drinking water, it must be used through an indirect loop to heat or preheat hot water.

The partial heat recovery pump must run at least three minutes after the partial heat recovery fan control is disabled. During the three minutes, water flow through the brazed plate heat exchanger will gradually be reduced and the unit can be switched to conventional cooling mode without partial heat recovery fan control.

NOTICE

If the partial heat recovery heat exchanger is drained the heater must be turned off to avoid damaging the partial heater recovery heat exchanger. The heater should only be on when the heat recovery heat exchanger has water in it.

Partial Heat Recovery Piping

A field installed safety or relief valve on the water side is required with the partial heat recovery to prevent risks resulting from a failure of the thermostat.

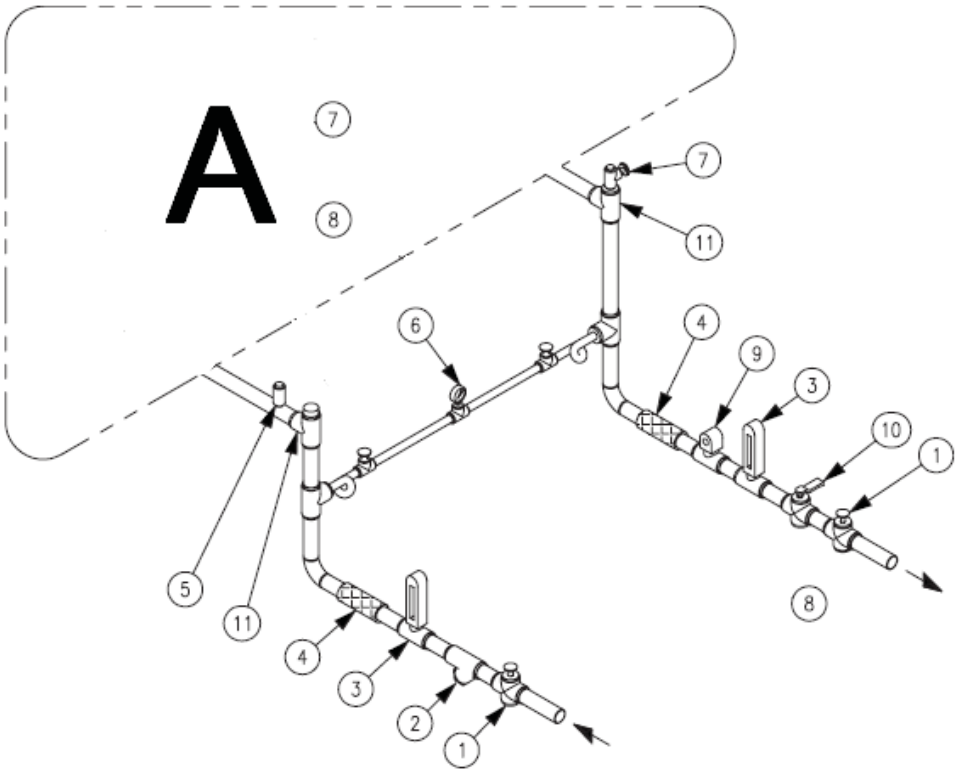
A 16 mesh strainer must be installed close to the partial heat recovery heat exchanger entering water line to protect the heat exchanger.

The partial heat recovery water temperature should be controlled via an external devise such as a 3-way valve or variable speed pump. In addition, a water tank and additional heater is suggested in the partial heat recovery loop.

Insulate water lines and other portions of the heat recovery water loop to prevent heat loss and potential injury due exposure to a hot surface.

For recommended partial heat recovery piping see below.

Figure 30. Partial Heat Recovery Piping Recommendations



A. Trane-supplied
1. Gate valve
2. Water strainer
3. Thermometer (user option)
4. Vibration eliminator
5. Relief valve
6. Valved pressure gauge
7. Vent **(one factory installed)**
8. Drain **(at lowest position)**
9. Flow switch (warm water flow)
10. Balancing valve
11. Clean out tee

Do not use untreated or improperly treated water in the heat recovery water loop since it will cause inefficient operation and potential damage to the unit such as: reduced heat transfer between water and refrigerant, increased water pressure drop and reduced water flow.

⚠ CAUTION
Proper Water Treatment!

The use of untreated or improperly treated water in a Chiller may result in scaling, erosion, corrosion, algae or slime. It is recommended that the services of a qualified water treatment specialist be engaged to determine what water treatment, if any, is required. Trane assumes no responsibility for equipment failures which result from untreated or improperly treated water, or saline or brackish water.

Partial Heat Recovery Freeze Protection

The heat recovery condenser is insulated and a factory-installed heater is installed and will protect the heat exchanger from freezing in ambient temperatures down to -20°F (-29°C).

When the ambient temperature drops to approximately 39°F (3.9°C) the thermostat energizes the heaters.

Note: The inlet and outlet piping should be protected against freezing by one of the following methods:

- Install heat tape on all field-installed water piping.
  OR
- Add freeze inhibit fluid to the partial heat recovery water loop.

Installation - Electrical

General Recommendations

All wiring must comply with local codes and the National Electric Code. Typical field wiring diagrams are included at the end of the manual. Minimum circuit ampacities and other unit electrical data are on the unit nameplate. See the unit order specifications for actual electrical data. Specific electrical schematics and connection diagrams are shipped with the unit.

⚠ WARNING
Hazardous Voltage!

Disconnect all electric power, including remote disconnects before servicing. Follow proper lockout/tagout procedures to ensure the power can not be inadvertently energized. Failure to disconnect power before servicing could result in death or serious injury.

⚠ CAUTION
Use Copper Conductors Only!

Unit terminals are not designed to accept other types of conductors. Failure to use copper conductors may result in equipment damage.

Important!

Do not allow conduit to interfere with other components, structural members or equipment. Control voltage (115V) wiring in conduit must be separate from conduit carrying low voltage (<30V) wiring. To prevent control malfunctions, do not run low voltage wiring (<30V) in conduit with conductors carrying more than 30 volts.

1. Data shown for circuit one. The second circuit is always the same.
2. RLA - Rated Load Amps - Rated in accordance with UL Standard 1995.
3. LRA - Locked Rotor Amps - Based on full winding starts.
4. Units have single point power connection as standard. Optional dual point power connections are available for 40-120 ton units.
5. Voltage Utilization Range: +/- 10% of rated voltage
   Rated voltage (use range): 208/60/3 (187.2-228.8), 230/60/3(208-254), 380/60/3 (342-418), 460/60/3 (414-506), 575/60/3 (516-633)
6. One separate 120/60/1, 15 amp customer provided power connection is required to power the heaters.

	460/60/3	2	4	8	1	3.2	50.6-50.6	320-320
	575/60/3	2	4	8	1	2.6	38.6-38.6	235-235

1. Data shown for circuit one. The second circuit is always the same.
2. RLA - Rated Load Amps - Rated in accordance with UL Standard 1995.
3. LRA - Locked Rotor Amps - Based on full winding starts.
4. Units have single point power connection as standard. Optional dual point power connections are available for 40-120 ton units.
5. Voltage Utilization Range: +/- 10% of rated voltage
   Rated voltage (use range): 208/60/3 (187.2-228.8), 230/60/3(208-254), 380/60/3 (342-418), 460/60/3 (414-506), 575/60/3 (516-633)
6. One separate 120/60/1, 15 amp customer provided power connection is required to power the heaters.

Table 14. Electrical Data - 60 Hz - Unit Wiring - MCA/MOPD

1. Data shown for circuit one. The second circuit is always the same.
2. RLA - Rated Load Amps - Rated in accordance with UL Standard 1995.
3. LRA - Locked Rotor Amps - Based on full winding starts.
4. Units have single point power connection as standard. Optional dual point power connections are available for 40-120 ton units.
5. Voltage Utilization Range:
   Rated voltage (use range): 400/50/3 (360-440)
6. One separate 120/50/1, 15 amp customer provided power connection is required to power the heaters.

Table 17. Electrical Data - 50 Hz - Unit Wiring - MCA/MOPD

Unit	Rated	Single Point Power		Dual Point Power			
Size	Power	MCA[1]	MOPD[2]	MCA[1]	MOPD[2]	MCA[1]	MOPD[2]
20	400/50/3	45.5	60	n/a			
26	400/50/3	54.5	70				
30	400/50/3	70.6	90				
35	400/50/3	78.8	110				
40	400/50/3	84.8	100	45.5	60	43.5	60
52	400/50/3	101.8	110	54.5	70	52.5	70
60	400/50/3	132.5	150	70.6	90	68.6	90
70	400/50/3	147.2	175	78.8	110	76.7	100
80	400/50/3	160.2	175	85.3	110	83.2	110
90	400/50/3	181.1	200	96.9	125	94.8	125
100	400/50/3	204.5	225	108.6	150	106.5	125
110	400/50/3	214.4	250	114.1	150	112.0	150
120	400/50/3	223.2	250	118.5	150	116.4	150

1. MCA - Minimum Circuit Ampacity-125 percent of largest compressor RLA plus 100 percent of all other loads per NEC 440-33 2008.
2. MOPD or Max Fuse or HACR type breaker-225 percent of the largest compressor RLA plus 100 percent of all other loads per NEC 440-22 2008.
3. Data shown for circuit one. The second circuit is always the same.
4. Local codes may take precedence.
5. n/a - means option not available with voltage.

1. Optional circuit breaker and high fault circuit breaker.
2. Will accept two conduits per phase in this size.
3. Copper wire only, based on nameplate Minimum Circuit Ampacity (MCA).
4. Data shown for circuit one. The second circuit is always the same.
5. n/a - not available

Installer-Supplied Components

Customer wiring interface connections are shown in the electrical schematics and connection diagrams that are shipped with the unit. The installer must provide the following components if not ordered with the unit:

- Power supply wiring (in conduit) for all field-wired connections.
- All control (interconnecting) wiring (in conduit) for field supplied devices.
- Circuit breakers.

Power Supply Wiring

⚠ WARNING
Ground Wire!

All field-installed wiring must be completed by qualified personnel. All field-installed wiring must comply with NEC and applicable local codes. Failure to follow this instruction could result in death or serious injuries.

All power supply wiring must be sized and selected accordingly by the project engineer in accordance with NEC Table 310-16.

⚠ WARNING
Hazardous Voltage!

Disconnect all electric power, including remote disconnects before servicing. Follow proper lockout/tagout procedures to ensure the power can not be inadvertently energized. Failure to disconnect power before servicing could result in death or serious injury.

All wiring must comply with local codes and the National Electrical Code. The installing (or electrical) contractor must provide and install the system interconnecting wiring, as well as the power supply wiring. It must be properly sized and equipped with the appropriate fused disconnect switches.

The type and installation location(s) of the fused disconnects must comply with all applicable codes.

⚠ CAUTION
Use Copper Conductors Only!

Unit terminals are not designed to accept other types of conductors. Failure to use copper conductors may result in equipment damage.

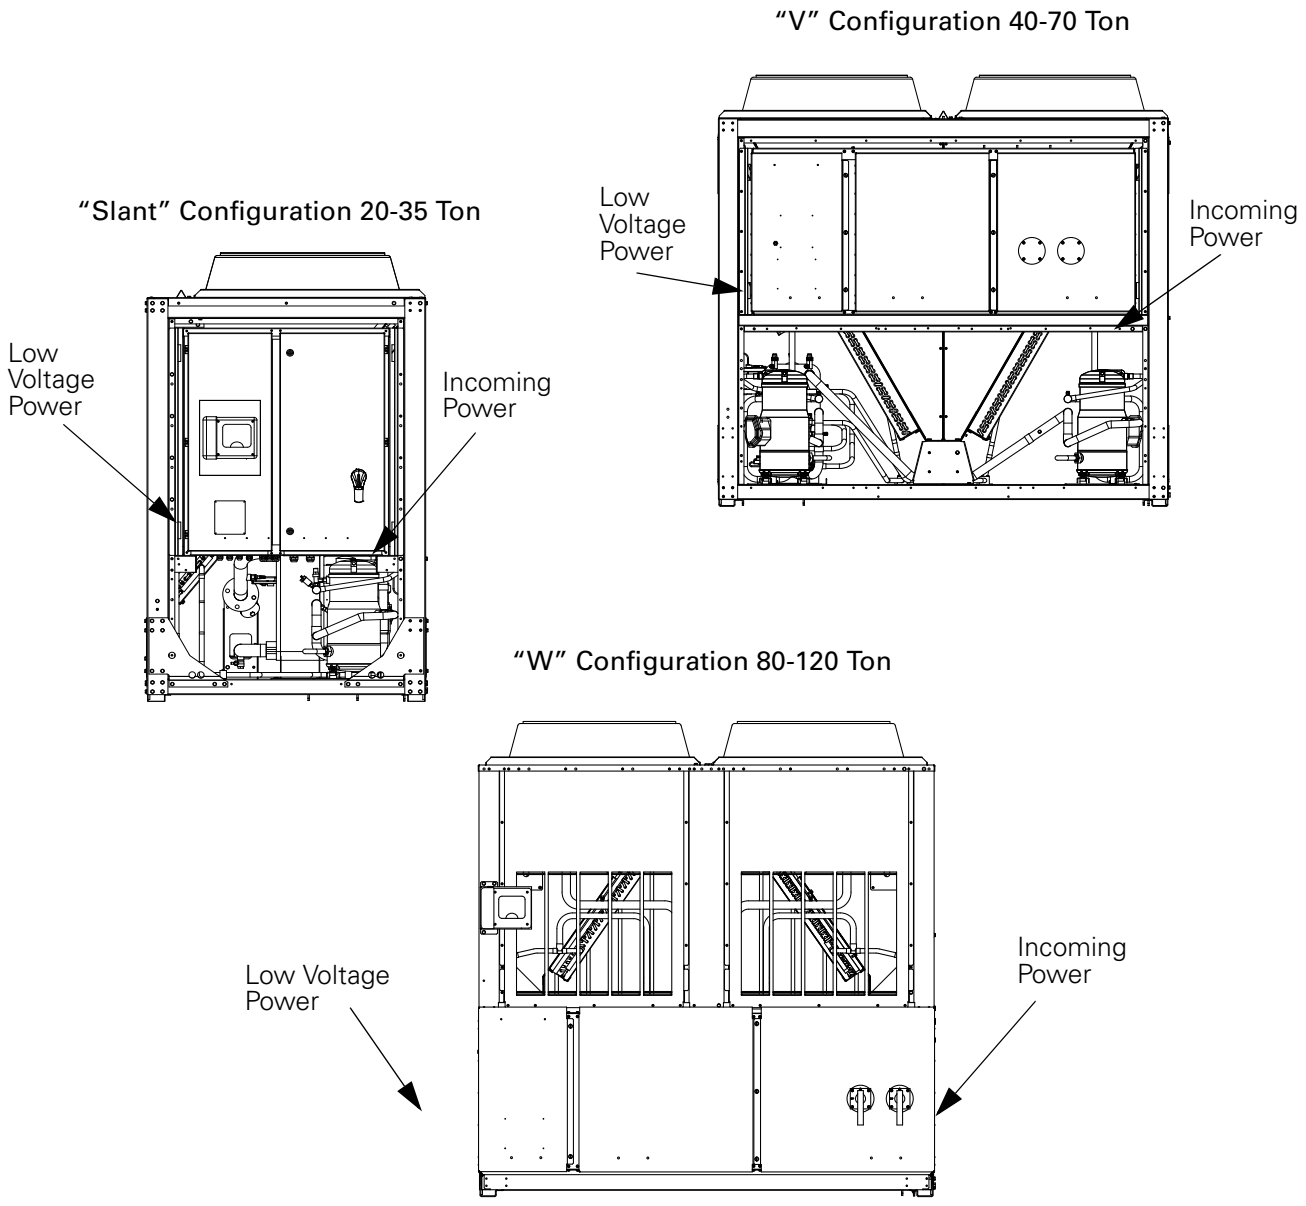
Knock-outs for wiring are located on the bottom right side of the control panel.The wiring is passed through these conduits and connected to the terminal blocks or HACR type breakers. Refer to Figure 31.

To provide proper phasing of 3-phase input, make connections as shown in field wiring diagrams and as stated on the WARNING label in the starter panel. For additional

information on proper phasing, refer to “Unit Voltage Phasing.” Proper equipment ground must be provided to each ground connection in the panel (one for each customer-supplied conductor per phase).

The high voltage field-provided connections are made through knockouts on the right side of the panel. The low voltage connections are made through the left side of the panel (Figure 31). Additional grounds may be required for each 115 volt power supply to the unit. Green lugs are provided for 115V customer wiring.

Figure 31. Power Entrance



Control Power Supply

The unit is equipped with a control power transformer; it is not necessary to provide additional control power voltage to the unit. No other loads should be connected to the control power transformer.

All units are factory-connected for appropriate labeled voltages.

⚠ CAUTION
Heat Tape!

Control panel main processor does not check for loss of power to the heat tape nor does it verify thermostat operation. A qualified technician must verify power to the heat tape and confirm operation of the heat tape thermostat to avoid catastrophic damage to the evaporator or partial heat recovery heat exchanger.

Heater Power Supply

The evaporator shell is insulated from ambient air and protected from freezing temperatures by a thermostatically-controlled immersion heater and strip heaters on the piping. When ever the ambient temperature drops to approximately 37°F (2.8°C) the thermostat energizes the heaters. The heaters will provide protection from ambient temperatures down to -20°F (-29°C).

It is required to provide an independent power source (115V 60-Hz-20 amp, 50Hz-15 amp), with a fused-disconnect to the heaters. The heaters are factory-wired back to the unit control panel.

Note: If evaporator is drained, the heater must be turned off in order to avoid damaging the evaporator. The heater should only be on when the evaporator has water in it.

Partial Heat Recovery Power Supply

The partial heat recover heat exchanger is insulated from ambient air and protected from freezing temperatures by an immersion heater. When ever the ambient air temperature drops to approximately 37°F (2.8°C) the thermostat energizes the heaters. The heaters will provide protection from ambient temperatures down to -20°F (-29°C).

It is required to provide an independent power source (115V 60-Hz-20 amp, 50Hz-15 amp), with a fused-disconnect to the heater. The heaters are factory-wired back to the unit control panel.

Note: If partial heat recovery heat exchanger is drained, the heater must be turned off in order to avoid damaging the partial heat recovery heat exchanger. The heater should only be on when the heat recovery heat exchanger has water in it.

Water Pump Power Supply

Provide power supply wiring with disconnect for the chilled water pump(s).

Interconnecting Wiring

Chilled Water Flow (Pump) Interlock

All CGAM model chillers have a factory-installed flow switch. In addition, it is recommended to use an additional field-supplied control voltage contact input through an auxiliary contact to prove flow. Connect the auxiliary contact to 1A17. Refer to the field wiring for details. The auxiliary contact can be a BAS signal, starter contactor auxiliary or any signal which indicates the pump is running.

Chilled Water Pump Control

An evaporator water pump output relay closes when the chiller is given a signal to go into the Auto mode of operation from any source. The contact is opened to turn off the pump in the event of most machine level diagnostics to prevent the build up of pump heat.

The relay output from 1A9 is required to operate the Evaporator Water Pump (EWP) contactor. Contacts should be compatible with 115/240 VAC control circuit. Normally, the EWP relay follows the AUTO mode of the chiller. Whenever the chiller has no diagnostics and is in the AUTO mode, regardless of where the auto command is coming from, the normally open relay is energized. When the chiller exits the AUTO mode, the relay is timed to open in an adjustable (using TechView) 0 to 30 minutes. The non-AUTO modes in which the pump is stopped, include Reset, Stop, External Stop, Remote Display Stop, Stopped by Tracer, Start Inhibited by Low Ambient Temp, and Ice Building complete.

NOTICE

Equipment damage!

If the microprocessor calls for a pump to start and water does not flow, the evaporator may be damaged catastrophically. It is the responsibility of the installing contractor and/or the customer to ensure that a pump will always be running when called upon by the chiller controls.

Table 19. Pump Relay Operation

Chiller Mode	Relay Operation
Auto	Instant close
Ice Building	Instant close
Tracer Override	Close
Stop	Timed to Open
Ice Complete	Instant Open
Diagnostics	Instant Open

When going from Stop to Auto, the EWP relay is energized immediately. If evaporator water flow is not established in 4 minutes and 15 seconds, the CH530 de-energizes the EWP relay and generates a non-latching diagnostic. If flow returns (e.g. someone else is controlling the pump), the diagnostic is cleared, the EWP relay is re-energized, and normal control resumed.

If evaporator water flow is lost once it has been established, the EWP relay remains energized and a non-latching diagnostic is generated. If flow returns, the diagnostic is cleared and the chiller returns to normal operation.

NOTICE
Equipment damage!

Do NOT enable/disable the chiller by removing water flow or equipment damage can occur.

In general, when there is either a non-latching or latching diagnostic, the EWP relay is turned off as though there was a zero time delay. The relay continues to be energized with:

A Low Chilled Water Temperature diagnostic (non-latching) unless also accompanied by an Evap Leaving Water Temperature Sensor Diagnostic.

or

A Loss of Evaporator Water Flow diagnostic (non-latching) and the unit is in the AUTO mode, after initially having proven evaporator water flow.

Note: If pump control is used for freeze protection then the pump MUST be controlled by the CGAM CH530 control. If another method of freeze protection is used (i.e. glycol, heaters, purge, etc) then the pump may be controlled by another system.

Chilled Water Pump Control - Field Supplied Dual Pumps

CH530 can provide pump control for two customer-supplied pumps, as long as the pump contactor coils 1A9 and connect the pump fault feedback signals 1A12 are properly connected .

In this situation, the unit will leave the factory with Evaporator Pump Control (EVPC) = No Pump Control (Pump Request Relay) (NPMP) and Evaporator Pump Fault Input (EVFI) = Installed (INST).When the contactors and pumps are set up in the field, the CH530 Service Tool (TechView) must be used to reconfigure to Evaporator Pump Control = Dual Pump Fixed Speed and Evaporator Pump Fault Input = Not Installed or Installed depending on how the fault feedback wire is connected. It is strongly recommended to install the Fault Input if possible as the controls will “hot-swap” the pumps upon detection of a fault, and may avoid the inevitable Flow Loss diagnostic (and unit shutdown) that will result if there is no fault feedback.

When configured for Dual Pump Fixed Speed, the CH530 will swap pumps on detection of a fault (if installed), or when a flow loss or overdue event occurs. It will also switch pumps each time the overall pump request is removed and re-engaged, unless a fault is detected on one of the pumps. If faults are detected on both pumps, the unit will be shut down.

In addition to the factory installed flow switch, a field-supplied auxiliary contact is required, so that the chiller will only detect flow if a pump is running and the flow switch says flow is present.

Alarm and Status Relay Outputs (Programmable Relays)

A programmable relay concept provides for enunciation of certain events or states of the chiller, selected from a list of likely needs, while only using four physical output relays, as shown in the field wiring diagram. The four relays are provided (generally with a Quad Relay Output LLID) as part of the Alarm Relay Output Option. The relay's contacts are isolated Form C (SPDT), suitable for use with 120 VAC circuits drawing up to 2.8 amps inductive, 7.2 amps resistive, or 1/3 HP and for 240 VAC circuits drawing up to 0.5 amp resistive.

The list of events/states that can be assigned to the programmable relays can be found in Table 20. The relay will be energized when the event/state occurs.

Table 20. Alarm and Status Relay Output Configuration Table

	Description
Alarm - Latching	This output is true whenever there is any active diagnostic that requires a manual reset to clear, that affects either the Chiller, the Circuit, or any of the Compressors on a circuit. This classification does not include informational diagnostics.
Alarm - Auto Reset	This output is true whenever there is any active diagnostic that could automatically clear, that affects either the Chiller, the Circuit, or any of the Compressors on a circuit. This classification does not include informational diagnostics.
Alarm	This output is true whenever there is any diagnostic affecting any component, whether latching or automatically clearing. This classification does not include informational diagnostics
Alarm Ckt 1	This output is true whenever there is any diagnostic effecting Refrigerant Circuit 1, whether latching or automatically clearing, including diagnostics affecting the entire chiller. This classification does not include informational diagnostics.
Alarm Ckt 2	This output is true whenever there is any diagnostic affecting Refrigerant Circuit 2 whether latching or automatically clearing, including diagnostics effecting the entire chiller. This classification does not include informational diagnostics.
Chiller Limit Mode (with a 20 minute filter)	This output is true whenever the chiller has been running in one of the Unloading types of limit modes (Condenser, Evaporator, Current Limit or Phase Imbalance Limit) continuously for the last 20 minutes.
Circuit 1 Running	This output is true whenever any compressor is running (or commanded to be running) on Refrigerant Circuit 1, and false when no compressors are commanded to be running on that circuit.
Circuit 2 Running	This output is true whenever any compressor is running (or commanded to be running) on Refrigerant Circuit 2, and false when no compressors are commanded to be running on that circuit.
Chiller Running	This output is true whenever any compressor is running (or commanded to be running) on the chiller and false when no compressors are commanded to be running on the chiller.
Maximum Capacity	This output is true whenever the chiller has all compressors on. The output is false once one compressor is shut off.

Relay Assignments Using TechView

CH530 Service Tool (TechView) is used to install the Alarm and Status Relay Option package and assign any of the above list of events or status to each of the four relays provided with the option. The relays to be programmed are referred to by the relay's terminal numbers on the LLID board 1A13.

The default assignments for the four available relays of the CGAM Alarm and Status Package Option are:

Table 21. Default Assignments

Relay	
Relay 1 Terminals J2 -12,11,10:	Alarm
Relay 2 Terminals J2 - 9,8,7:	Chiller Running
Relay 3 Terminals J2-6,5,4:	Maximum Capacity (software 18.0 or later)
Relay 4 Terminals J2-3,2,1:	Chiller Limit

If any of the Alarm/Status relays are used, provide electrical power, 115 VAC with fused-disconnect to the panel and wire through the appropriate relays (terminals on 1A13. Provide wiring (switched hot, neutral, and ground connections) to the remote annunciation devices. Do not use power from the chiller's control panel transformer to power these remote devices. Refer to the field diagrams which are shipped with the unit.

Low Voltage Wiring

⚠ WARNING
Ground Wire!

All field-installed wiring must be completed by qualified personnel. All field-installed wiring must comply with NEC and applicable local codes. Failure to follow this instruction could result in death or serious injuries.

The remote devices described below require low voltage wiring. All wiring to and from these remote input devices to the Control Panel must be made with shielded, twisted pair conductors. Be sure to ground the shielding only at the panel.

Note: To prevent control malfunctions, do not run low voltage wiring (<30 V) in conduit with conductors carrying more than 30 volts.

Emergency Stop

CH530 provides auxiliary control for a customer specified/installed latching trip out. When this customer-furnished remote contact 5K24 is provided, the chiller will run normally when the contact is closed. When the contact opens, the unit will trip on a manually resettable diagnostic. This condition requires manual reset at the chiller switch on the front of the control panel.

Connect low voltage leads to terminal strip locations on 1A13, J2-3 and 4. Refer to the field diagrams that are shipped with the unit.

Silver or gold-plated contacts are recommended. These customer-furnished contacts must be compatible with 24 VDC, 12 mA resistive load.

External Auto/Stop

If the unit requires the external Auto/Stop function, the installer must provide leads from the remote contact 5K23 to the proper terminals on 1A13, J2-1 and 2.

The chiller will run normally when the contact is closed. When the contact opens, the compressor(s), if operating, will go to the RUN:UNLOAD operating mode and cycle off.

Unit operation will be inhibited. Closure of the contact will permit the unit to return to normal operation.

Field-supplied contacts for all low voltage connections must be compatible with dry circuit 24 VDC for a 12 mA resistive load. Refer to the field diagrams that are shipped with the unit.

NOTICE
Equipment damage!

Do NOT enable/disable the chiller by removing water flow or equipment damage can occur.

Ice Building Option

CH530 provides auxiliary control for a customer specified/installed contact closure for ice building if so configured and enabled. This output is known as the Ice Building Status Relay. The normally open contact will be closed when ice building is in progress and open when ice building has been normally terminated either through Ice Termination setpoint being reached or removal of the Ice Building command. This output is for use with the ice storage system equipment or controls (provided by others) to signal the system changes required as the chiller mode changes from "ice building" to "ice complete". When contact 5K16 is provided, the chiller will run normally when the contact is open.

CH530 will accept either an isolated contact closure (External Ice Building command) or a Remote Communicated input (Tracer) to initiate and command the Ice Building mode.

CH530 also provides a "Front Panel Ice Termination Setpoint", settable through TechView, and adjustable from 20 to 31°F (-6.7 to -0.5°C) in at least 1°F (1°C) increments.

When in the Ice Building mode, and the evaporator entering water temperature drops below the ice termination setpoint, the chiller terminates the Ice Building mode and changes to the Ice Building Complete Mode.

⚠ CAUTION
Evaporator Damage!

Freeze inhibitor must be adequate for the leaving water temperature. Failure to do so may result in damage to system components.

TechView may also be used to enable or disable Ice Machine Control. This setting does not prevent the Tracer from commanding Ice Building mode.

Upon contact closure, the CH530 will initiate an ice building mode, in which the unit runs fully loaded at all times. Ice building shall be terminated either by opening the contact or based on the entering evaporator water temperature. CH530 will not permit the ice building mode to be reentered until the unit has been switched out of ice building mode (open 5K20 contacts) and then switched back into ice building mode (close 5K20 contacts.)

In ice building, all limits (freeze avoidance, evaporator, condenser, current) will be ignored. All safeties will be enforced.

If, while in ice building mode, the unit gets down to the freeze stat setting (water or refrigerant), the unit will shut down on a manually resettable diagnostic, just as in normal operation.

Connect leads from 5K20 to the proper terminals of 1A16. Refer to the field diagrams which are shipped with the unit.

Silver or gold-plated contacts are recommended. These customer furnished contacts must be compatible with 24 VDC, 12 mA resistive load.

External Chilled Water Setpoint (ECWS) Option

The CH530 provides inputs that accept either 4-20 mA or 2-10 VDC signals to set the external chilled water setpoint (ECWS). **This is not a reset function.** The input defines the set point. This input is primarily used with generic BAS (building automation systems). The chilled water setpoint set via the DynaView or through digital communication with Tracer.

The chilled water setpoint may be changed from a remote location by sending either a 2-10 VDC or 4-20 mA signal to the 1A14, J2-1 and 2. The 2-10 VDC and 4-20 mA each correspond to a 10 to 65°F (-12 to 18°C) external chilled water setpoint.

The following equations apply:

	Voltage Signal	Current Signal
As generated from external source	VDC=0.1455*(ECWS)+0.5454	mA=0.2909(ECWS)+1.0909
As processed by CH530	ECWS=6.875*(VDC)-3.75	ECWS=3.4375(mA)-3.75

If the ECWS input develops an open or short, the LLID will report either a very high or very low value back to the main processor. This will generate an informational diagnostic and the unit will default to using the Front Panel (DynaView) Chilled Water Setpoint.

TechView Service Tool is used to set the input signal type from the factory default of 2-10 VDC to that of 4-20 mA. TechView is also used to install or remove the External Chilled Water Setpoint option as well as a means to enable and disable ECWS.

External Demand Limit Setpoint (EDLS) Option

CH530 provide a means to limit the capacity of the chiller by limiting the number of compressors or stages that are allowed to run. The maximum number of compressor or stages allowed to run can vary from one to the number of stages on the unit. The staging algorithm is free to decide which compressor or stage shall be turned off or prevented from running to meet this requirement.

CH530 shall accept either a 2-10 VDC or 4-20 mA analog input suitable for customer connection to set the unit external demand limit setpoint (EDLS).

2-10 VDC and 4-20 mA shall each correspond to an EDLS range with a minimum of 0% and a maximum of 100%. The following equations exist.

Global Scroll	Voltage Signal	Current Signal
As generated from external source	Vdc = 8*(EDLS) + 2	mA = 16*(EDLS) + 4
As processed by CH530	EDLS = (Vdc - 2)/8	EDLS = (mA - 4)/16

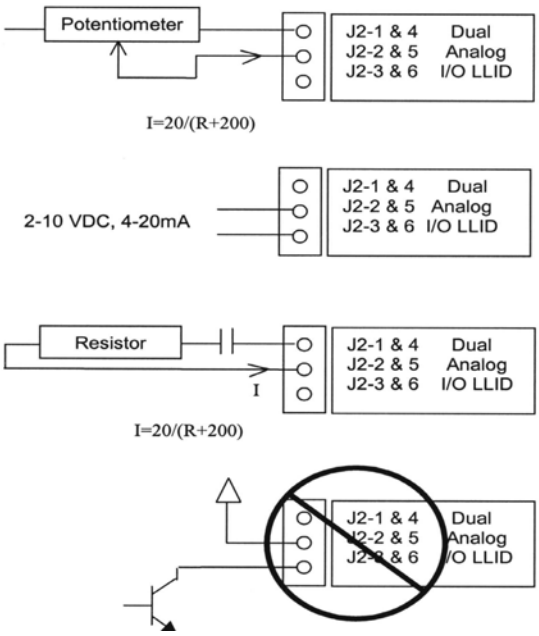
The minimum EDLS will be clamped at the front panel based on 100% / Total number of Compressors. For input signals beyond the 2-10VDC or 4-20mA range, the end of range value shall be used. For example, if the customer inputs 21 mA, the EDLS shall limit it self to the corresponding 20 mA EDLS.

ECLS and EDLS Analog Input Signal Wiring Details:

Both the ECLS and EDLS can be connected and setup as either a 2-10 VDC (factory default), 4-20 mA, or resistance input (also a form of 4-20 mA) as indicated below. Depending on the type to be used, the TechView Service Tool must be used to configure the LLID and the MP for the proper input type that is being used. This is accomplished by a setting change on the Custom Tab of the Configuration View within TechView.

The J2-3 and J2-6 terminal is chassis grounded and terminal J2-1 and J2-4 can be used to source 12 VDC. The ECLS uses terminals J2-2 and J2-3. EDLS uses terminals J2-5 and J2-6. Both inputs are only compatible with high-side current sources.

Figure 32. Wiring Examples for ECLS and EDLS



Chilled Water Reset (CWR)

CH530 resets the chilled water temperature set point based on either return water temperature, or outdoor air temperature. Return Reset is standard, Outdoor Reset is optional.

The following shall be selectable:

- One of three Reset Types: None, Return Water Temperature Reset, Outdoor Air Temperature Reset, or Constant Return Water Temperature Reset.
- Reset Ratio Set Points.
- For outdoor air temperature reset there shall be both positive and negative reset ratio's.
- Start Reset Set Points.
- Maximum Reset Set Points.

The equations for each type of reset are as follows:

Return

CWS' = CWS + RATIO (START RESET - (TWE - TWL))

and CWS' > or = CWS

and CWS' - CWS < or = Maximum Reset

Outdoor

CWS' = CWS + RATIO * (START RESET - TOD)

and CWS' > or = CWS

and CWS' - CWS < or = Maximum Reset

where

CWS' is the new chilled water set point or the "reset CWS"

CWS is the active chilled water set point before any reset has occurred, e.g. normally Front Panel, Tracer, or ECWS

RESET RATIO is a user adjustable gain

START RESET is a user adjustable reference

TOD is the outdoor temperature

TWE is entering evap. water temperature

TWL is leaving evap. water temperature

MAXIMUM RESET is a user adjustable limit providing the maximum amount of reset. For all types of reset, CWS' - CWS < or = Maximum Reset.

Reset Type	Reset Ratio Range	Start Reset Range	Maximum Reset Range	Increment English Units	Increment SI Units	Factory Default Value
Return:	10 to 120%	4 to 30 F	0 to 20 F	1%	1%	50%
		(2.2 to 16.7 C)	(0.0 to 11.1 C)			
Outdoor	80 to -80%	50 to 130 F	0 to 20 F	1%	1%	10%
		(10 to 54.4 C)	(0.0 to 11.1 C)			

In addition to Return and Outdoor Reset, the MP provides a menu item for the operator to select a Constant Return Reset. Constant Return Reset will reset the leaving water temperature set point so as to provide a constant entering water temperature. The Constant Return Reset equation is the same as the Return Reset equation except on selection of Constant Return Reset, the MP will automatically set Ratio, Start Reset, and Maximum Reset to the following.

RATIO = 100%

START RESET = Design Delta Temp.

MAXIMUM RESET = Design Delta Temp.

The equation for Constant Return is then as follows:

CWS' = CWS + 100% (Design Delta Temp. - (TWE - TWL))

and CWS' > or = CWS

and CWS' - CWS < or = Maximum Reset

When any type of CWR is enabled, the MP will step the Active CWS toward the desired CWS' (based on the above equations and setup parameters) at a rate of 1 degree F every 5 minutes until the Active CWS equals the desired CWS'. This applies when the chiller is running.

When the chiller is not running the CWS is reset immediately (within one minute) for Return Reset and at a rate of 1 degree F every 5 minutes for Outdoor Reset. The chiller will start at the Differential to Start value above a fully reset CWS or CWS' for both Return and Outdoor Reset.

Communications Interface options

Tracer Communications Interface

This option allows the Tracer CH530 controller to exchange information (e.g. operating setpoints and Auto/Standby commands) with a higher-level control device, such as a Tracer Summit or a multiple-machine controller. A shielded, twisted pair connection establishes the bi-directional communications link between the Tracer CH530 and the building automation system.

Note: To prevent control malfunctions, do not run low voltage wiring (<30 V) in conduit with conductors carrying more than 30 volts.

⚠ WARNING
Ground Wire!

All field-installed wiring must be completed by qualified personnel. All field-installed wiring must comply with NEC and applicable local codes. Failure to follow this instruction could result in death or serious injuries.

Field wiring for the communication link must meet the following requirements:

- All wiring must be in accordance with the NEC and local codes.
- Communication link wiring must be shielded, twisted pair wiring (Belden 8760 or equivalent). See the table below for wire size selection:

Table 22. Wire Size

Wire Size	Maximum Length of Communication Wire
14 AWG (2.5 mm^2)	5,000 FT (1525 m)
16 AWG (1.5 mm^2)	2,000 FT (610 m)
18 AWG (1.0 mm^2)	1,000 FT (305 m)

- The communication link cannot pass between buildings.
- All units on the communication link can be connected in a “daisy chain” configuration.

LonTalk Communications Interface for Chillers (LCI-C)

CH530 provides an optional LonTalk Communication Interface (LCI-C) between the chiller and a Building Automation System (BAS). An LCI-C LLID shall be used to provide "gateway" functionality between a LonTalk compatible device and the Chiller. The inputs/outputs include both mandatory and optional network variables as established by the LonMark Functional Chiller Profile 8040.

Installation Recommendations

- 22 AWG Level 4 unshielded communication wire recommended for most LCI-C installations
- LCI-C link limits: 4500 feet, 60 devices
- Termination resistors are required
- 105 ohms at each end for Level 4 wire
- 82 ohms at each end for Trane "purple" wire
- LCI-C topology should be daisy chain
- Zone sensor communication stubs limited to 8 per link, 50 feet each (maximum)
- One repeater can be used for an additional 4500 feet, 60 devices, 8 communication stubs

Table 23. LonTalk Points List

Inputs/Outputs	Length and Contents	SNVT / UNVT

CGAM Operating Principles

This section contains an overview of the operation of CGAM air-cooled liquid chiller equipped with microcomputer-based control systems. It describes the overall operating principles of the CGAM water chiller.

Note: To ensure proper diagnosis and repair, contact a qualified service organization if a problem should occur.

General

The Model CGAM units are scroll compressor air-cooled liquid chillers. These units are equipped with unit-mounted starter/control panels and operates with R-410A refrigerant.

The basic components of an CGAM unit are:

- Unit-mounted panel containing starter and Tracer CH530 controller and Input/Output LLIDS
- Scroll compressors
- Brazed plate evaporator
- Air-cooled condenser with subcooler
- Electronic expansion valve
- Optional partial heat recovery
- Related interconnecting piping.

Components of a typical CGAM unit are identified in the following diagrams.

Figure 33. Slant 20-35 Ton Component Location

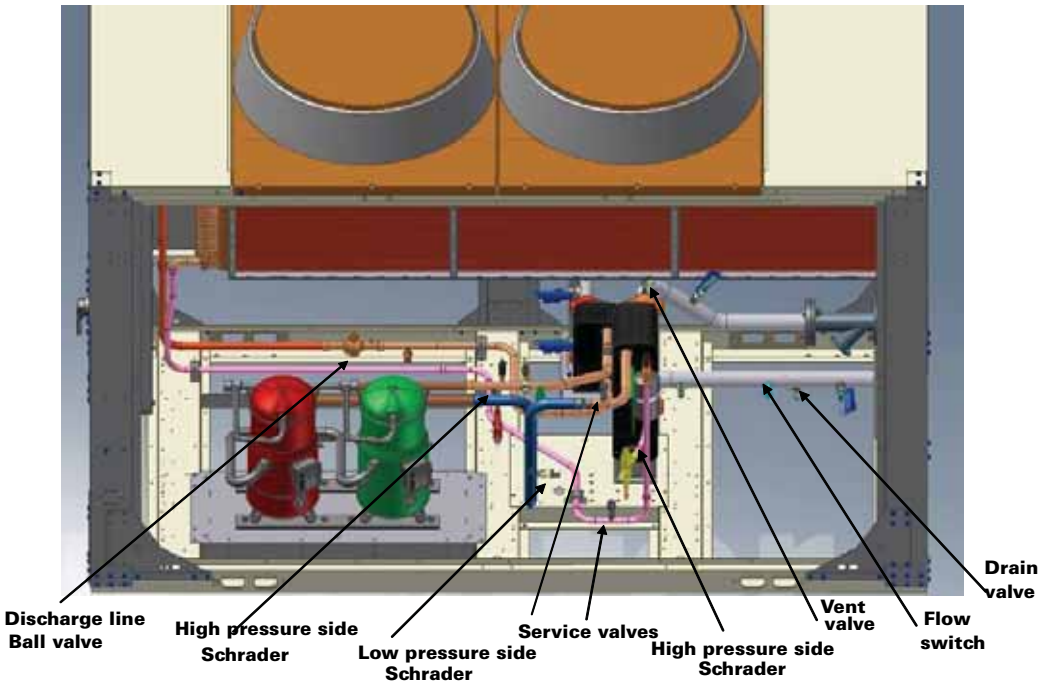

Figure 34. V 40-70 Ton Component Location - circuit 1

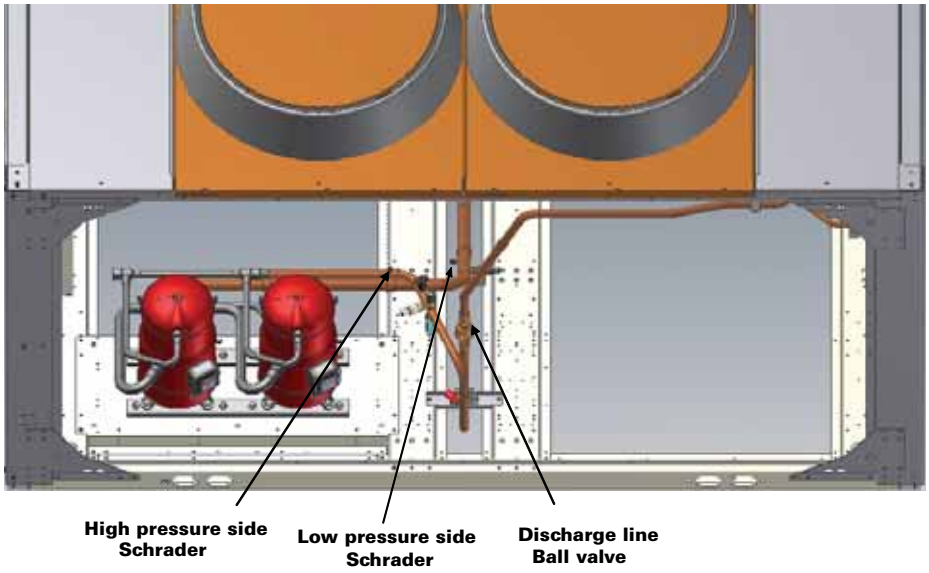

Figure 35. V 40-70 Ton Component Location- circuit 2

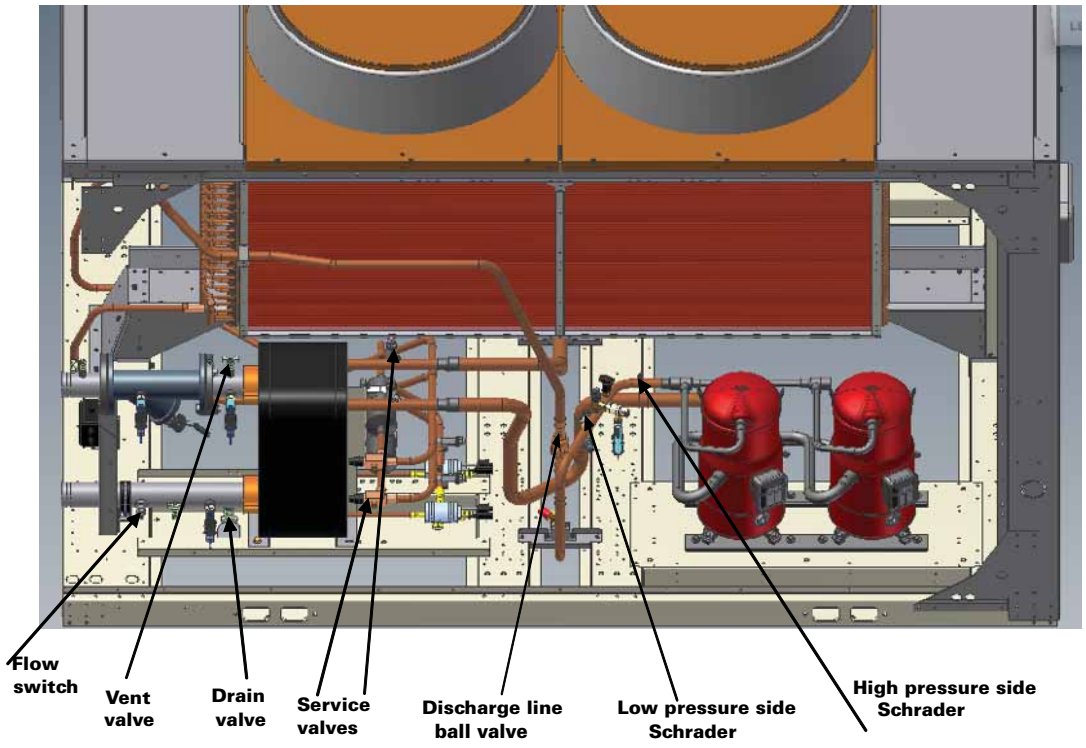

Figure 36. W 80-120 Ton Component Location - compressor view

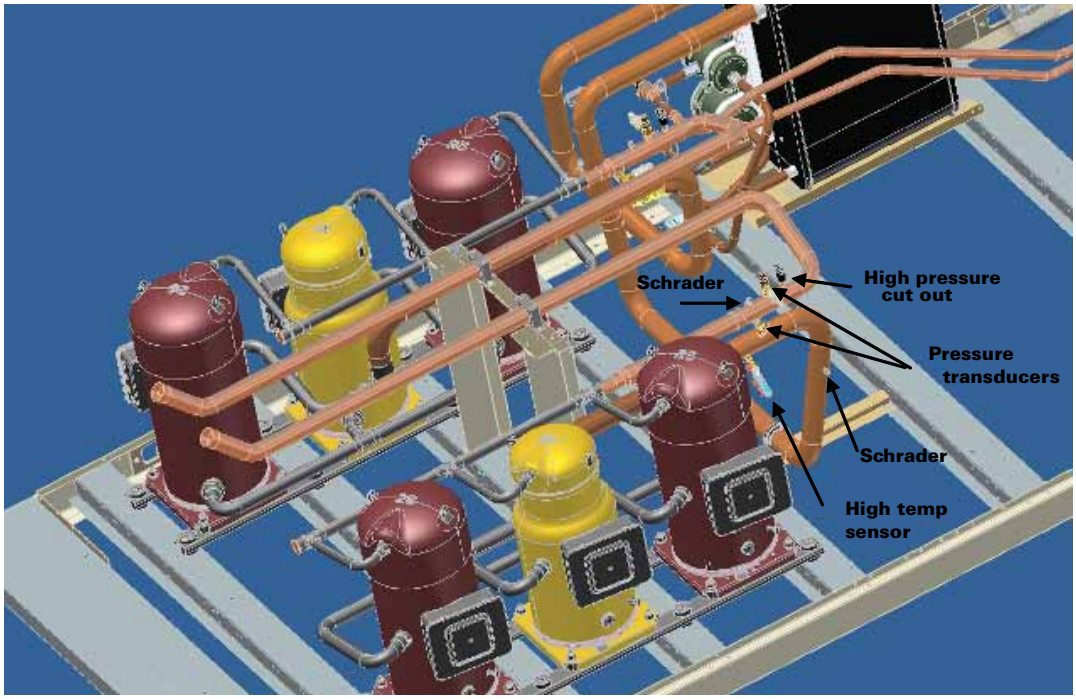

Figure 37. W 80-120 Ton Component Location - evaporator side

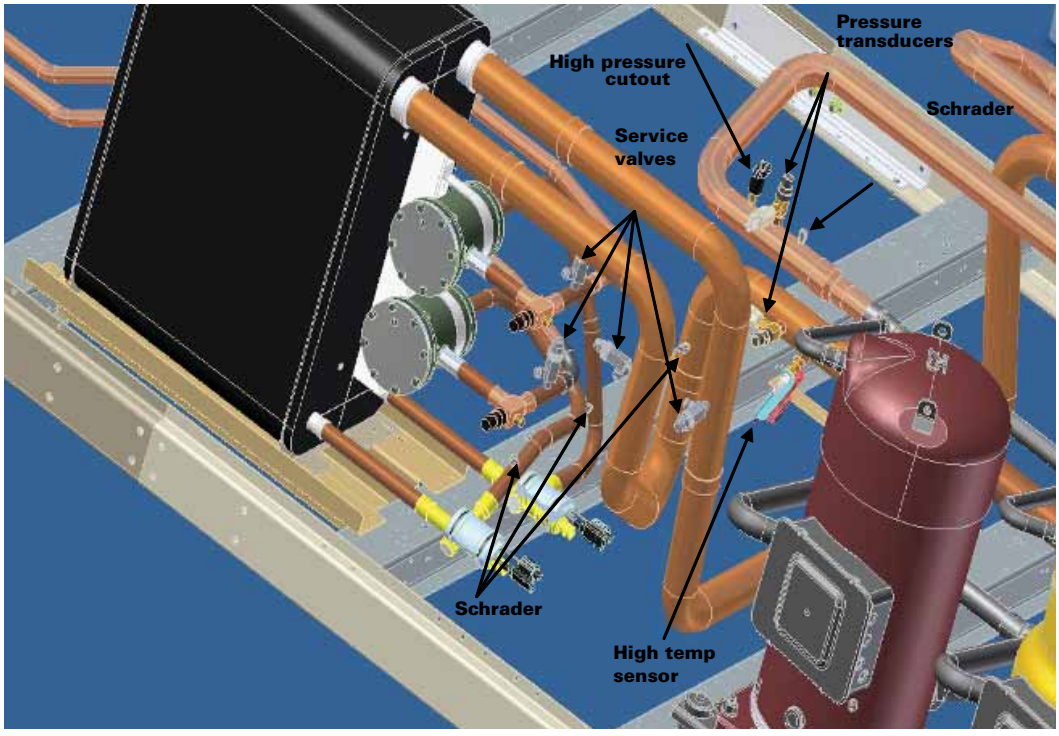

Refrigerant Cycle

The refrigeration cycle of the Model CGAM chiller is conceptually similar to other Trane air-cooled chiller products. The CGAM chiller uses a brazed plate evaporator and an air-cooled condenser. The compressors use suction gas cooled motors and an oil management system to provide almost oil-free refrigerant to the condenser and evaporator for maximum heat transfer while lubricating and sealing compressor bearings. The lubrication system helps to assure long compressor life and contributes to quiet operation.

Refrigerant condensers in the air-cooled heat exchanger which is available in three configurations—slant, V and W—based on the CGAM nominal tonnage cooling capacity. Liquid refrigerant is metered into the brazed plate evaporator using an electronic expansion valve to maximize chiller efficiency at full and part load operation.

The CGAM chiller is equipped with a unit-mounted starter and control panel. Microprocessor-based unit control modules (Trane Tracer™ CH530) provide accurate chilled water control and provide monitoring, protection and adaptive limit functions. The adaptive nature of the controls intelligently prevent the chiller from operating outside of its limits, or compensates for unusual operating conditions while keeping the chiller running rather than simply shutting off the chiller. If problems do occur, the CH530 controls provide diagnostic messages to help the operator in troubleshooting.

Refrigerant Cycle Description

The CGAM refrigeration cycle is described using the pressure-enthalpy chart shown in Figure 38. Key State Points 1 through 5 are indicated on the chart. A schematic showing refrigerant components throughout the system is shown in Figure 39.

Refrigerant evaporation occurs in the brazed plate evaporator. Metered refrigerant vaporizes as it cools the chilled water or liquid flowing through the evaporator passages. The refrigerant vapor leaves the evaporator as superheated gas. State Point 1.

Refrigerant vapor generated in the evaporator flows to the compressor suction manifold where it enters and flows across the compressor motor windings to provide cooling. The vapor is then compressed in the compressor scroll chambers and discharged. Oil from the compressor sump lubricates the bearings and seals the small clearances between the compressor scrolls. Refrigerant vapor is discharged to the air-cooled condenser at State Point 2.

After the refrigerant vapor condenses into liquid (State Points 3 and 4) it is returned to the evaporator (State Point 5) where the refrigerant again flashes into vapor and the refrigeration cycle repeats.

Figure 38. Pressure/Enthalpy Curve

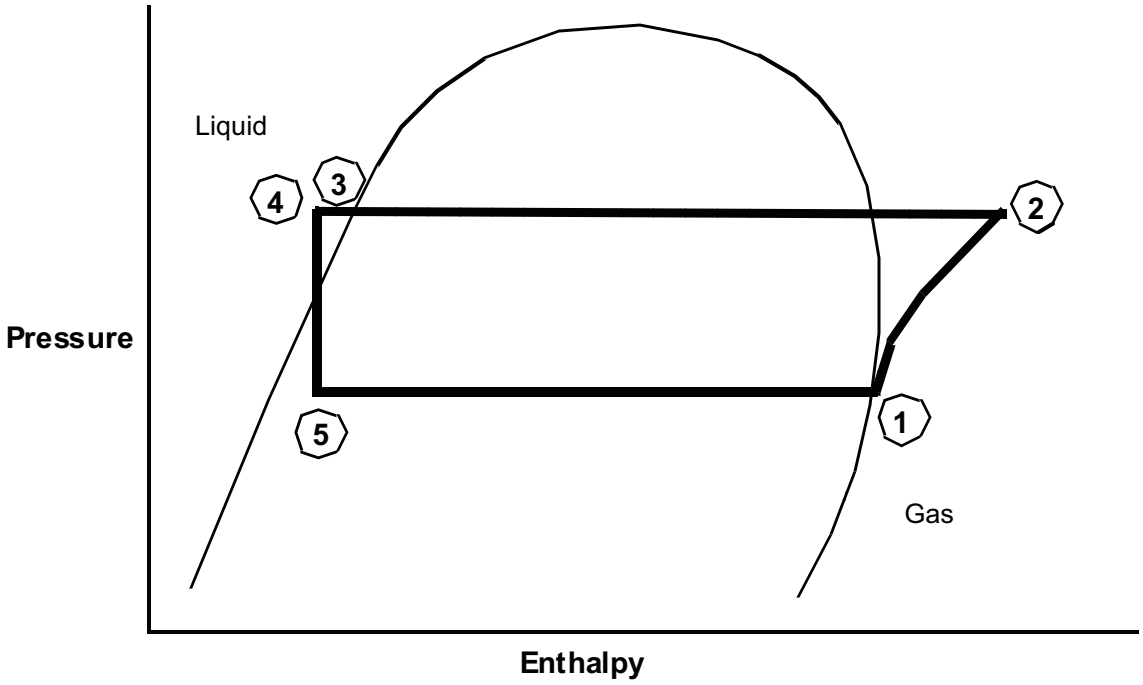

Figure 39. CGAM Refrigerant Circuit

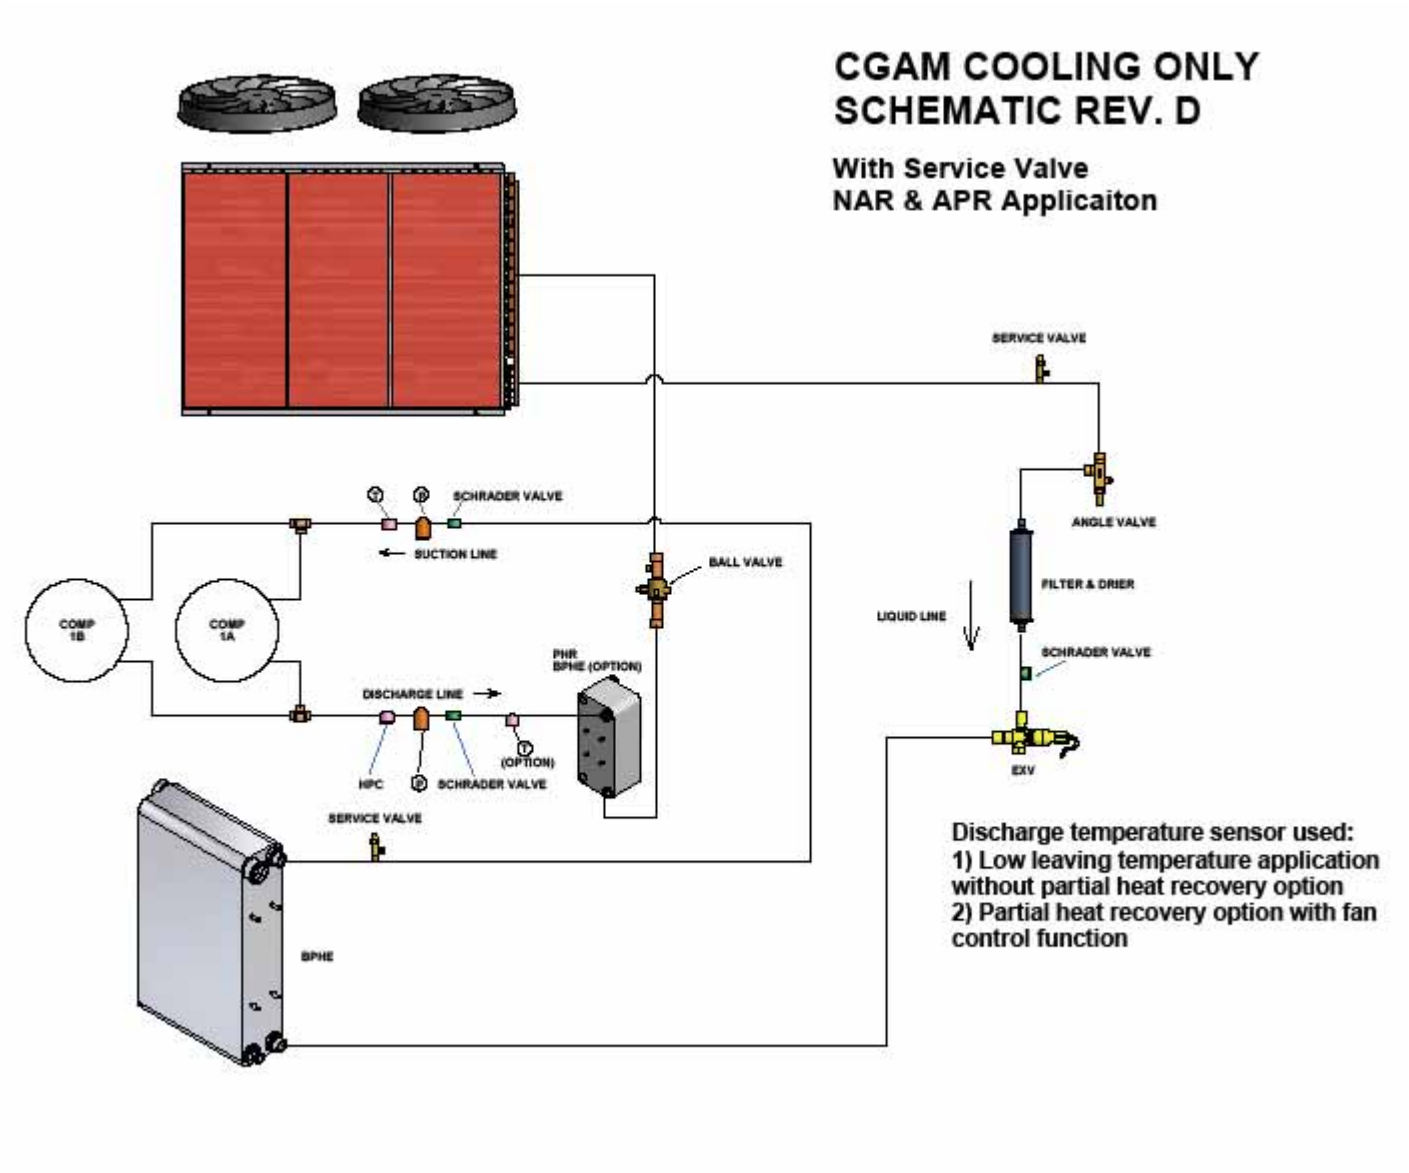

Oil System Operation (CGAM)

Overview

The oil is efficiently separated inside the scroll compressor and will remain in the scroll compressor during all run cycles. Between 1-2% of the oil circulates around with the refrigerant.

Figure 40. CGAM Scroll Compressor Sizes

Controls Interface

CH530 Communications Overview

The Trane CH530 control system that runs the chiller consists of several elements:

- The main processor collects data, status, and diagnostic information and communicates commands to the starter module and the LLID (for Low Level Intelligent Device) bus. The main processor has an integral display (DynaView).
- Low level intelligent device (LLID) bus. The main processor communicates to each input and output device (e.g. temperature and pressure sensors, low voltage binary inputs, analog input/output) all connected to a four-wire bus, rather than the conventional control architecture of signal wires for each device.
- The communication interface to a building automation system (BAS).
- A service tool to provide all service/maintenance capabilities.

Main processor and service tool (TechView) software is downloadable from www.trane.com. The process is discussed later in this section under TechView Interface.

DynaView provides bus management. It has the task of restarting the link, or filling in for what it sees as "missing" devices when normal communications has been degraded. Use of TechView may be required.

The CH530 uses the IPC3 protocol based on RS485 signal technology and communicating at 19.2 Kbaud to allow 3 rounds of data per second on a 64-device network. A typical four-compressor CGAM will have around 30 devices.

Most diagnostics are handled by the DynaView. If a temperature or pressure is reported out of range by a LLID, the DynaView processes this information and calls out the diagnostic. The individual LLIDs are not responsible for any diagnostic functions.

Note: It is imperative that the CH530 Service Tool (TechView) be used to facilitate the replacement of any LLID or reconfigure any chiller component. TechView is discussed later in this section.

Controls Interface

Each chiller is equipped with a DynaView interface. The DynaView has the capability to display information to the operator including the ability to adjust settings. Multiple screens are available and text is presented in multiple languages as factory-ordered or can be easily downloaded from www.trane.com.

TechView can be connected to either the DynaView module and provides further data, adjustment capabilities, diagnostics information using downloadable software.

DynaView Interface

The DynaView share the same enclosure design: weatherproof and durable plastic for use as a stand-alone device on the outside of the unit or mounted nearby.

The display on DynaView is a 1/4 VGA display with a resistive touch screen and an LED backlight. The display area is approximately 4 inches wide by 3 inches high (102mm x 60mm).

Key Functions

In this touch screen application, key functions are determined completely by software and change depending upon the subject matter currently being displayed. The basic touch screen functions are outlined below.

Radio Buttons

Radio buttons show one menu choice among two or more alternatives, all visible. The radio button model mimics the buttons used on old-fashioned radios to select stations. When one is pressed, the one that was previously pressed "pops out" and the new station is selected. In the DynaView model the possible selections are each associated with a button. The selected button is darkened, presented in reverse video to indicate it is the selected choice. The full range of possible choices as well as the current choice is always in view.

Spin Value Buttons

Spin values are used to allow a variable setpoint to be changed, such as leaving water setpoint. The value increases or decreases by touching the increment (+) or decrement (-) arrows.

Action Buttons

Action buttons appear temporarily and provide the user with a choice such as **Enter** or **Cancel.**

Hot Links

Hot links are used to navigate from one view to another view.

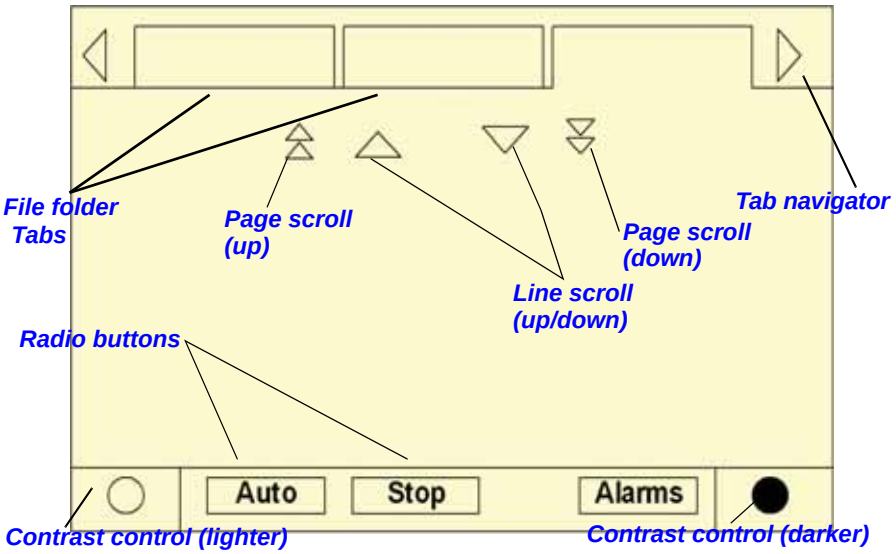
File Folder Tabs

File folder tabs are used to select a screen of data. Just like tabs in a file folder, these serve to title the folder/screen selected, as well as provide navigation to other screens. In DynaView, the tabs are in one row across the top of the display. The folder tabs are separated from the rest of the display by a horizontal line. Vertical lines separate the tabs from each other. The folder that is selected has no horizontal line under its tab, thereby making it look like a part of the current folder (as would an open folder in a file cabinet). The user selects a screen of information by touching the appropriate tab.

Display Screens

Basic Screen Format

The basic screen format appears as:



The file folder tabs across the top of the screen are used to select the various display screens.

Scroll arrows are added if more file tabs (choices) are available. When the tabs are at the left most position, the left navigator will not show and only navigation to the right will be possible. Likewise when the right most screen is selected, only left navigation will be possible.

The main body of the screen is used for description text, data, setpoints, or keys (touch sensitive areas). The Chiller Mode is displayed here.

The double up arrows cause a page-by-page scroll either up or down. The single arrow causes a line by line scroll to occur. At the end of the page, the appropriate scroll bar will disappear.

A double arrow pointing to the right indicates more information is available about the specific item on that same line. Pressing it will bring you to a subscreen that will present the information or allow changes to settings.

The bottom of the screen (Fixed Display) is present in all screens and contains the following functions. The **left circular area** is used to reduce the contrast/viewing angle of the display. **The right circular area** is used to increase the contrast/viewing angle of the display. The contrast may require re-adjustment at ambient temperatures significantly different from those present at last adjustment.

The other functions are critical to machine operation. The AUTO and STOP keys are used to enable or disable the chiller. The key selected is in black (reverse video). The chiller will stop when the STOP key is touched and after completing the Shutting Down mode.

Touching the AUTO key will enable the chiller for active cooling if no diagnostic is present. (A separate action must be taken to clear active diagnostics.)

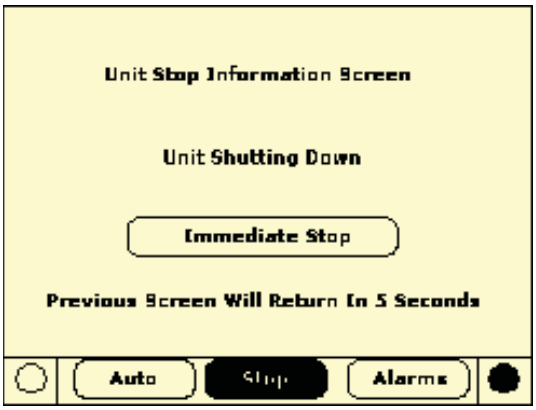
The AUTO and STOP keys, take precedence over the Enter and Cancel keys. (While a setting is being changed, AUTO and STOP keys are recognized even if Enter or Cancel has not been pressed.)

The ALARMS button appears only when an alarm is present, and blinks (by alternating between normal and reverse video) to draw attention to a diagnostic condition. Pressing the ALARMS button takes you to the corresponding tab for additional information.

Auto, Stop/Immediate Stop

The Auto and Stop keys will be presented as radio buttons within the persistent key display area. The selected key will be black.

The chiller will stop when the Stop key is touched, entering the Run Unload mode. An informational screen will be displayed for 5 seconds indicating that a second depression of an “Immediate Stop” key during this time period will result in an immediate stop. Pressing the “Immediate Stop” key while the immediate stop screen is displayed, will cause the unit to stop immediately, skipping operational pumpdown.



NOTICE

Equipment damage!

Do NOT enable/disable the chiller by removing water flow or equipment damage can occur.

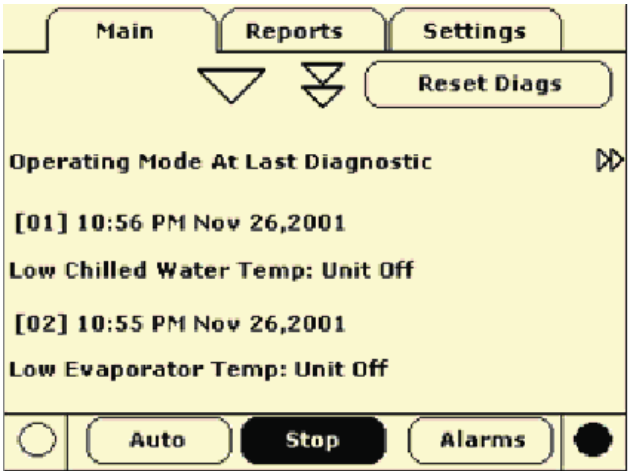
Touching the Auto key will arm the chiller for active cooling if no diagnostic is present. As in UCP2, a separate action must be taken to clear active diagnostics.

The AUTO and STOP, take precedence over the ENTER and CANCEL keys. (While a setting is being changed, AUTO and STOP keys are recognized even if ENTER or CANCEL has not been pressed.

Diagnostic Annunciation

When an active diagnostic is present, an Alarms key will be added to the persistent display area. This key will serve two purposes. The first purpose will be to alert the operator that a diagnostic exists. The second purpose is to provide navigation to a diagnostic display screen.

Diagnostic Screen

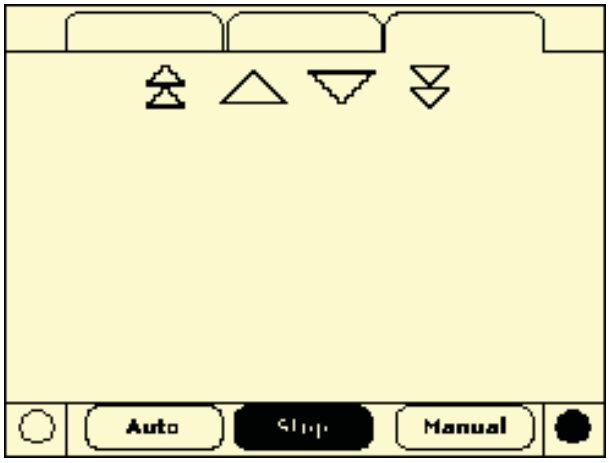


A complete listing of diagnostics and codes is included in the Diagnostic Section.

Manual Override Exists

An indicator to present the presence of a manual override will share space with the Alarms enunciator key. While a manual override exists, the space used for the Alarms key will be occupied by a "Manual" icon, that will display solid inverse color similar to the appearance of the Alarms enunciator. An Alarm will take precedence of the Manual, until the reset of active alarms, at which point the Manual indicator would re-appear if such an override exists.

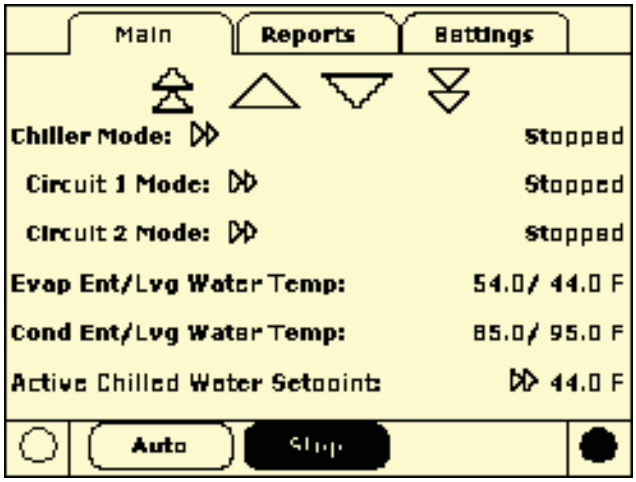
If the Manual indicator is pressed, the Manual Control Settings screen will be displayed.



Main Screen

The Main screen is a “dashboard” of the chiller. High level status information is presented so that a user can quickly understand the mode of operation of the chiller.

The Chiller Operating Mode will present a top level indication of the chiller mode (i.e. Auto, Running, Inhibit, Run Inhibit, etc.). The “additional info” icon will present a subscreen that lists in further detail the subsystem modes.



The Main screen shall be the default screen. After an idle time of 30 minutes the CH530 shall display the Main screen with the first data fields.

The remaining items (listed in the following table) will be viewed by selecting the up/down arrow icons.

Table 24. Main Screen Data Fields Table

Description	Units	Resolution
Chiller Mode (>> submodes)	enumeration	
Circuit Mode (>> submodes)	enumeration	
Circuit 1 Mode (>> submodes)	enumeration	
Circuit 2 Mode (>> submodes)	enumeration	
Evap Ent/Lvg Water Temp	F / C	0.1
Active Chilled Water Setpoint (>>source)	F / C	0.1
Active Hot Water Setpoint (>>source)	F / C	0.1
Active Demand Limit Setpoint (>>source)	%	1
Outdoor Air Temperature	F / C	0.1
Software Type	enumeration	Scroll
Software Version		X.XX

Chiller Operating Mode

The machine-operating mode indicates the operational status of the chiller. A subscreen with additional mode summary information will be provided by selection of an additional information icon (>>). The operating mode line will remain stationary while the remaining status items scroll with the up/down arrow keys.

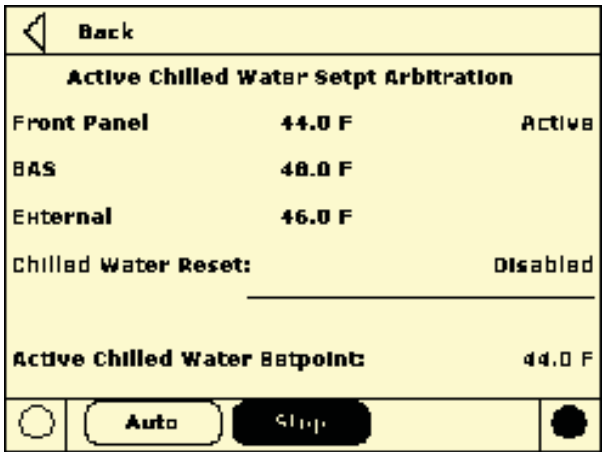
Active Chilled Water Setpoint

The active chilled water setpoint is the setpoint that is currently in use. It results from the logical hierarchy of setpoint arbitration by the main processor. It will be displayed to 0.1 degrees Fahrenheit or Celsius.

Touching the double arrow to the left of the Active Chilled Water Setpoint will take the user to the active chilled water setpoint arbitration sub-screen.

Active Chilled Water Subscreen

The active chilled water setpoint is that setpoint to which the unit is currently controlling. It is the result of arbitration between the front panel, BAS, schedule, external, and auxiliary setpoints (schedule and auxiliary not shown in the following diagram), which in turn may be subjected to a form of chilled water reset.



The chilled water reset status area in the right most column will display one of the following messages

- Return
- Constant Return
- Outdoor
- Disabled

The left column text “Front Panel”, “BAS” or “Schedule”, “External”, “Auxiliary”, “Chilled Water Reset”, and “Active Chilled Water Setpoint” will always be present regardless of installation or enabling those optional items. In the second column “-----” will be shown if that option is Not Installed, otherwise the current setpoint from that source will be shown.

Setpoints that are adjustable from the DynaView (Front Panel Chilled Water Setpoint, Auxiliary Chilled Water Setpoint) will provide navigation to their respective setpoint change screen via a double-arrow to the right of the setpoint source text. The setpoint change screen will look identical to the one provided in the Chiller Setpoints screen. The "Back" button on the setpoint change screen provides navigation back to the setpoint arbitration screen.

The "Back" button on the setpoint arbitration screen provides navigation back to the chiller screen.

Other Active Setpoints

The Active Demand Limit Setpoint will behave the same was as the Active Chilled Water Setpoint, except that its units are in percent and there is an Ice Building source in place of the Auxiliary source. Front Panel Demand Limit Setpoint will provide navigation to its setpoint change screen.

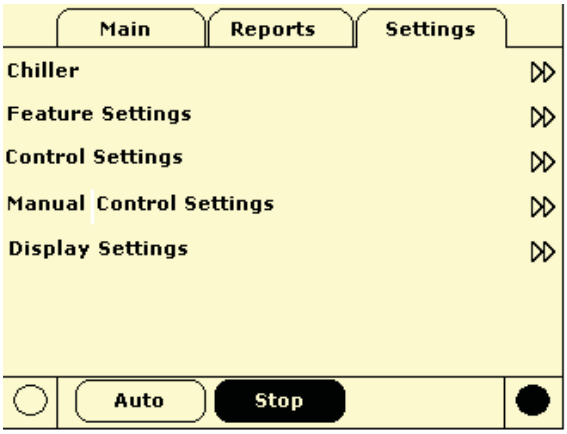
Password-Protected Settings

The user can change some settings from the DynaView display on the chiller. Other settings are password-protected. In order to change these setting the password is 314.

Settings Screen

The Settings screen provides a user the ability to adjust settings necessary to support daily tasks. The layout provides a list of sub-menus, organized by typical subsystem. This organization allows each subscreen to be shorter in length which should improve the user's navigation.

A sample Settings screen is a list of the subsystems as shown below.



Settings Sub-Screens - Table of Text, Data, Ranges, etc.

Below is the table of text, resolution, field size, enumerated selections, and data for Settings subscreens. See the functional specification "CGAM Settings and Setpoints" for further information such as ranges and operation.

Table 25. Unit

Description	Resolution or (Enumerations)	Units
Front Panel Cool	Cool	Enum

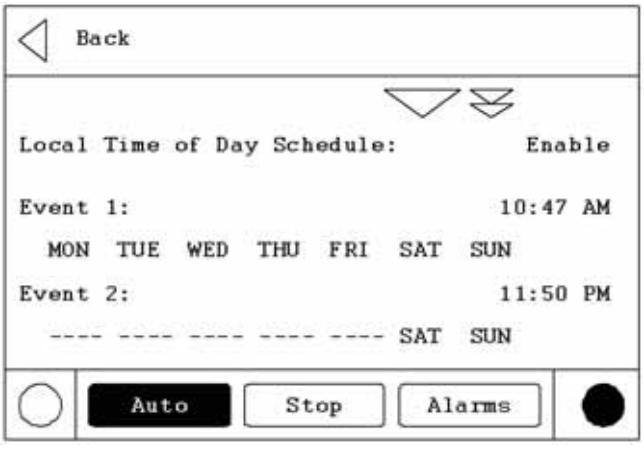
Local Time of Day Schedule Screen

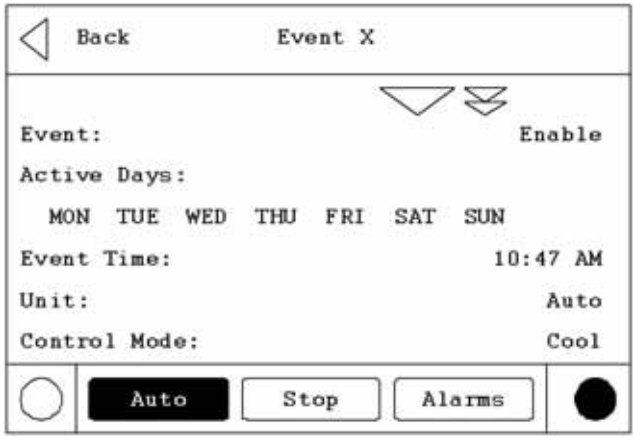
To access the Local Time of Day Schedule Screen this option must be installed in TechView. This option will then be shown under the Feature Settings screen.

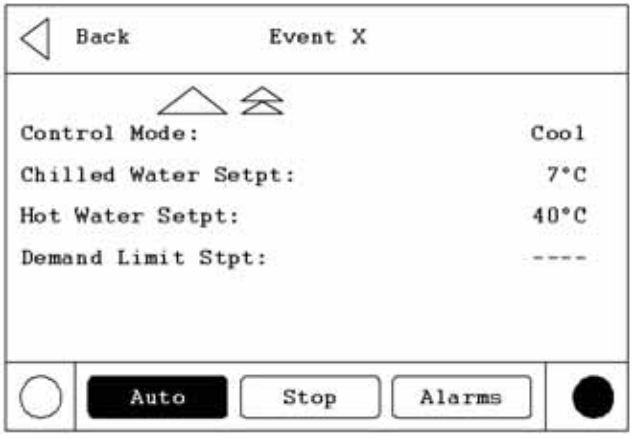
This screen shows the overall feature enable/disable setting, plus a listing of all 10 events, including their event time and active days of the week.



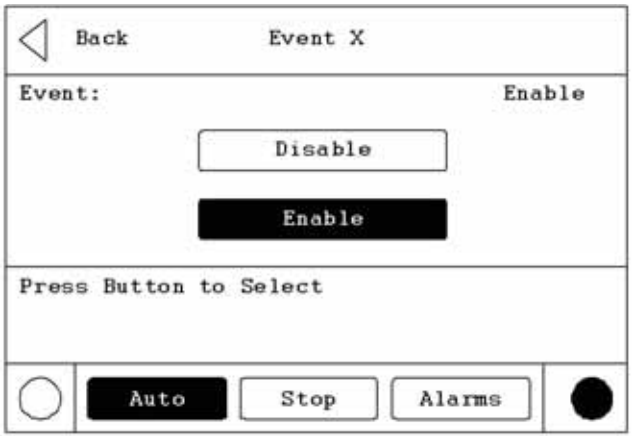
Local Settings Event Screen

This screen displays the details for a particular event, including the active days, event time, and the Local Schedule arbitrated setpoints. Selecting a given item will allow the user to modify it.



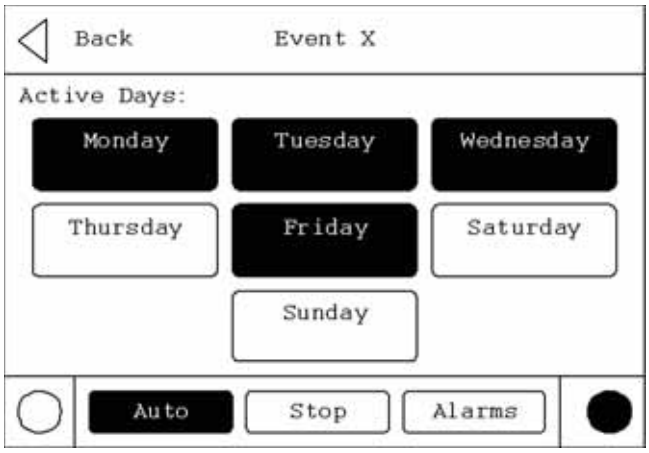


Event Enable/Disable Screen

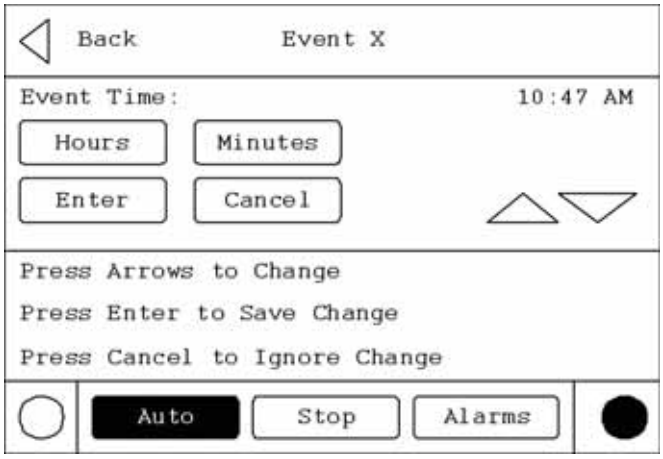


Event Active Days Screen

This screen is unusual because it does not use radio buttons, which only allow one active selection at a time. These buttons are more like “selection buttons” or check boxes. The user can select any combination of days, or none at all.



Event Time Screen



Event Arbitrated Settings Screens

For analog setpoints, the screen is slightly different than the standard screen, because there are two additional buttons - “Used” and “Not Used”. Selecting “Used” will make the setting valid and allow the user to change the value. Selecting “Not Used” will make the setting invalid, and will not allow the user to change the value.

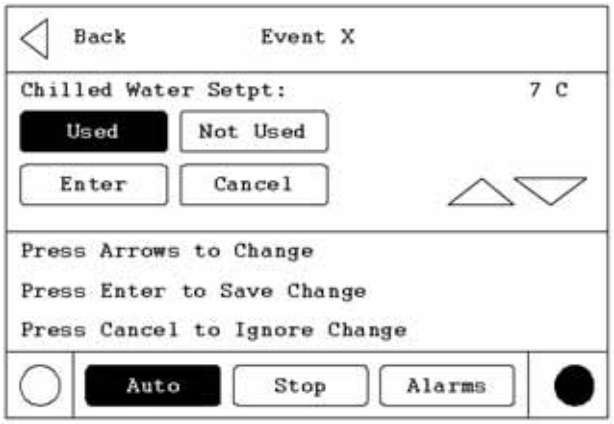


Table 32. Display Settings

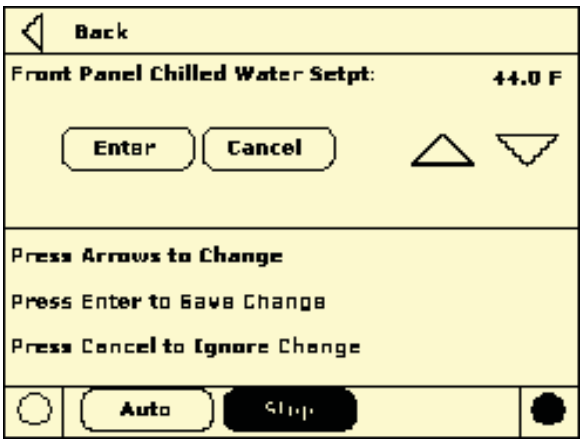
Description	Resolution or (Enumerations), Default	Units
Date Format	(“mmm dd, yyyy”, “dd-mmm-yyyy”), “mmm dd, yyyy	Enum
Date[4]		
Time Format	(12-hour, 24-hour), 12-hour	Enum
Time of Day[4]		
Keypad/Display Lockout[3]	(Enable, Disable), Disable	Enum
Display Units	(SI, English), English	Enum
Pressure Units	(Absolute, Gauge), Gauge	Enum
Local Atmospheric Pressure:	XXX.X	Pressure (always absolute)
Language[1]	(English, Selection 2, Selection 3), English (0)	Enum

(1) Language choices are dependent on what the Service Tool has setup in the Main Processor. Get Radio Button names from Main Processor setups. Language selections will include English and qty 2 alternate as loaded by TechView.
(2) Temperatures will be adjustable to 0.1 deg F or C. The Main Processor will provide the minimum and maximum allowable value.
(3) Enables a DynaView Lockout screen. All other screens time-out in 30 minutes to this screen. The DynaView Lockout Screen will have 0-9 keypad to permit the user to re-enter the other DynaView screens with a fixed password. See below for further details.
(4) The Date and Time setup screen formats deviate slightly from the standard screens defined above. See the alternate screen layouts below.
(5) Language shall always be the last setting listed on the Control Settings menu (which will also always be the last item listed on the Settings menu list). This will allow a user to easily find language selection if looking at an unrecognizable language.
(6) The pump on mode terminates after 60 minutes.

Upon selecting a Settings list all setpoints available to change along with their current value will appear. The operator selects a setpoint to change by touching either the verbal description or setpoint value. Doing this causes the screen to switch to either the Analog Settings Subscreen or the Enumerated Settings Subscreen.

Analog Setting Subscreens

Analog Settings Subscreen displays the current value of the chosen setpoint in the upper ½ of the display. It is displayed in a changeable format consistent with its type. Binary setpoints are considered to be simple two state enumerations and will use radio buttons. Analog setpoints are displayed as spin buttons. The lower half of the screen is reserved for help screens.

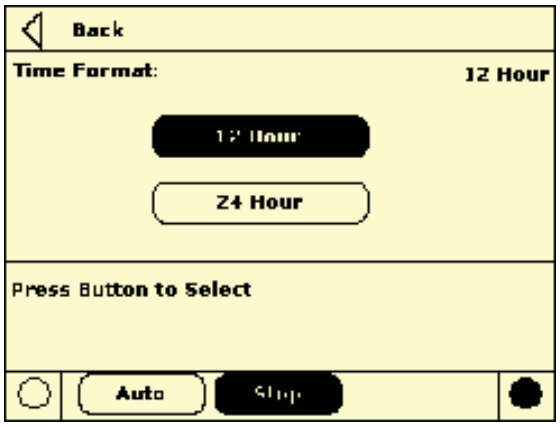


All setpoint subscreens will execute the equivalent of a Cancel key if any display activities cause the subscreen to be left before a new setpoint is entered. E.g. if the Alarms key is pressed before a new setpoint is entered, the new setpoint will be cancelled. The same applies to any time-outs.

Pressing the Auto or Stop keys will not cause a cancel since the setpoint subscreen is not left on this action.

Enumerated Settings Subscreen

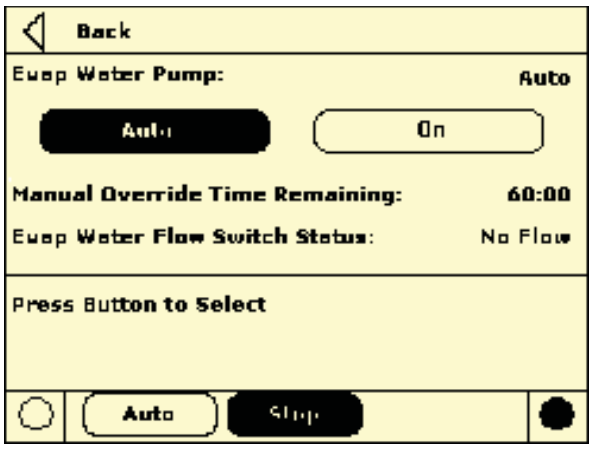
The enumerated setpoint subscreen has no cancel or enter key. Once a radio key is depressed the item is immediately set to the new enumeration value.



Mode Override Subscreens

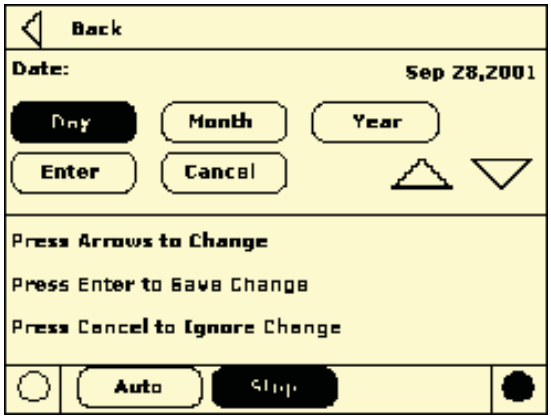
The Mode Override subscreen has no cancel or enter key. Once a radio key is depressed that new value is immediately assumed.

Mode Override for Enumerated Settings is shown below:

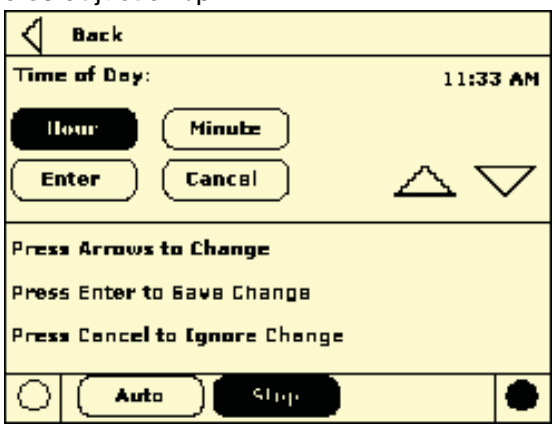


Date/Time Subscreen

The setpoint screen for setting up the CH530 date is shown below: The user must select Day, Month, or Year and then use the up/down arrows to adjust.



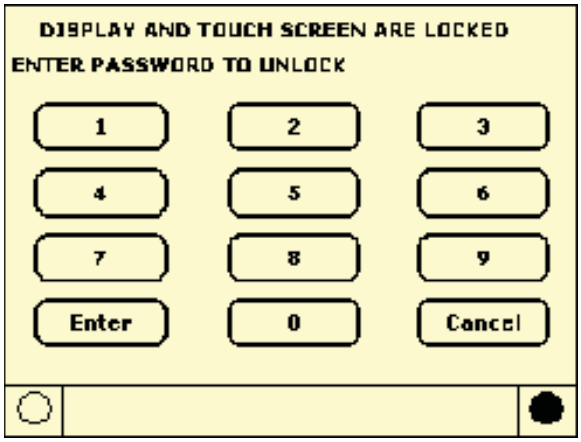
The setpoint screen for setting up the CH530 time with a 12 hour format is shown below: The user must select Hour, or Minute and then use the up/down arrows to adjust. Adjusting hours will also adjust am/pm.



Lockout Screen

The DynaView Display and Touch Screen Lock screen is shown. This screen is used if the Display and Touch Screen Lock feature is Enabled. Thirty minutes after the last key stroke this screen will be displayed and the Display and Touch Screen will be locked out until "159 Enter" is entered.

Until the proper password is entered there will be no access to the DynaView screens including all reports, all setpoints, and Auto/Stop/Alarms/Interlocks. The password "159" is not programmable from either DynaView or TechView.

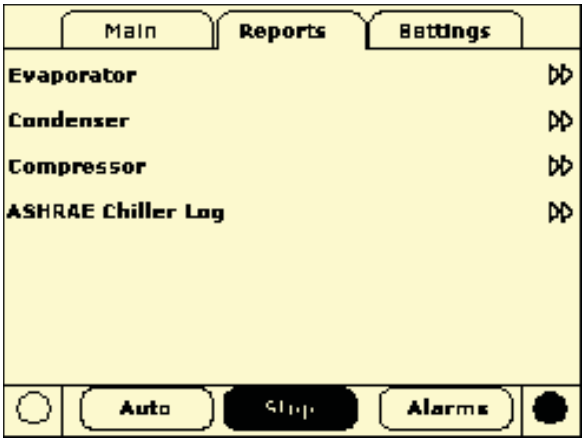


If the Display and Touch Screen Lock feature is Disabled, a similar screen including "Enter 159 to Unlock" will show if the MP temperature is approximately less than 32°F (0°C) and it has been 30 minutes after the last key stroke. Note: the main processor is equipped with an on-board temp sensor which enables the ice protection feature (OAT is not required).

Freezing rain can form on the touch panel and actuate the touch screen as the rain freezes on its surface. A specific pattern of key presses will avoid this issue.

Reports

The Reports tab will allow a user to select from a list of possible reports headings (i.e. Custom, ASHRAE Guideline 3, Refrigerant, etc.) Each report will generate a list of status items as defined in the tables that follow:



Historic Diagnostics are also included in this menu.

Table 33. Report name: System Evaporator

Description	Resolution	Units
Evap Entering Water Temp:	+ or - XXX.X	Temperature

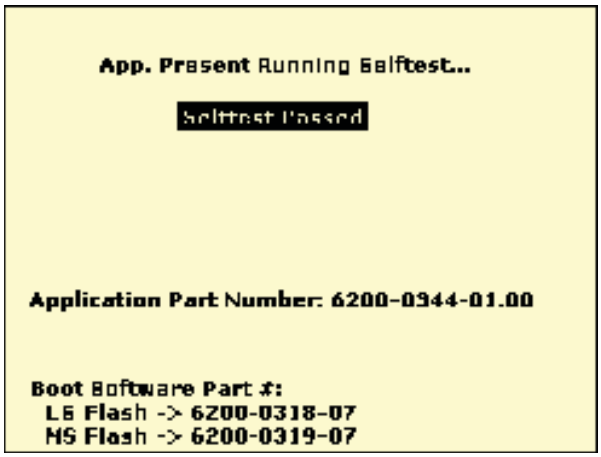
Power Up and Self Tests

Power-Up DynaView

On Power-Up DynaView will progress through three screens:

First Screen, Application Status, Boot Software P/N, Self Test and Application Time Stamp.

This screen will display for 3-10 seconds. This screen will give the status of the Application software, the Boot Software P/N, display Self Test results and display the Application Part Number (CGAM 6200-0450-01). The contrast will also be adjustable from this screen. The message “Selftest Passed” may be replaced with “Err2: RAM Error” or “Err3: CRC Failure”



Display Formats

Temperature settings can be expressed in F or C, depending on Display Units settings.

Pressure settings can be expressed in psia, psig, kPaa (kPa absolute), or kPag (kPa gauge) depending on Display Units settings.

Dashes (“-----”) appearing in a temperature or pressure report, indicates that the value is invalid or not applicable.

Languages

The languages for DynaView will reside in the main processor. The main processor will hold three languages, English, and two alternate languages. The service tool (TechView) will load the main processor with user selected languages from a list of available translations.

TechView

TechView is the PC (laptop) based tool used for servicing Tracer CH530. Technicians that make any chiller control modification or service any diagnostic with Tracer CH530 must use a laptop running the software application "TechView." TechView is a Trane application developed to minimize chiller downtime and aid the technicians understanding of chiller operation and service requirements.

Note: Important: Performing any Tracer CH530 service functions should be done only by a properly trained service technician. Please contact your local Trane service agency for assistance with any service requirements.

TechView software is available via Trane.com.

(http://www.trane.com/commercial/software/tracerch530/)

This download site provides a user the TechView installation software and CH530 main processor software that must be loaded onto your PC in order to service a CH530 main processor. The TechView service tool is used to load software into the Tracer CH530 main processor.

Minimum PC requirements to install and operate TechView

- Pentium II or higher processor
- 128Mb RAM
- 1024 x 768 resolution of display
- 56K modem
- 9-pin RS-232 serial connection
- Operating system - Windows 2000
- Microsoft Office (MS Word, MS Access, MS Excel)
- Parallel Port (25-pin) or USB Port

Note: TechView was designed for the preceding listed laptop configuration. Any variation will have unknown results. Therefore, support for TechView is limited to only those operating systems that meet the specific configuration listed here. Only computers with a Pentium II class processor or better are supported; Intel Celeron, AMD, or Cyrix processors have not been tested.

TechView is also used to perform any CH530 service or maintenance function. Servicing a CH530 main processor includes:

- Updating main processor software
- Monitoring chiller operation
- Viewing and resetting chiller diagnostics
- Low Level Intelligent Device (LLID) replacement and binding
- Main processor replacement and configuration modifications
- Setpoint modifications
- Service overrides

Software Download

Instructions for First Time TechView Users

This information can also be found at http://www.trane.com/commercial/software/tracerch530/.

1. Create a folder called "CH530" on your C:\ drive. You will select and use this folder in subsequent steps so that downloaded files are easy to locate.
2. Download the Java Runtime installation utility file onto your PC in the CH530 folder (please note that this does not install Java Runtime, it only downloads the installation utility).
   - Click on the latest version of Java Runtime shown in the TechView Download table.
   - Select "Save this program to disk" while downloading the files (do not select "Run this program from its current location").
3. Download the TechView installation utility file onto your PC in the CH530 folder (please note that this does not install TechView, it only downloads the installation utility).
   - Click on the latest version of TechView shown in the TechView Download table.
   - Select "Save this program to disk" while downloading the files (do not select "Run this program from its current location").
4. Remember where you downloaded the files (the "CH530" folder). You will need to locate them to finish the installation process.
5. Proceed to "Main Processor Software Download" page and read the instructions to download the latest version of main processor installation files.

Note: you will first select the chiller type to obtain the available file versions.

Unit View

Unit view is a summary for the system organized by chiller subsystem. This provides an overall view of chiller operating parameters and gives you an “at-a-glance” assessment of chiller operation.

The Control Panel tab displays important operating information for the unit and allows you to change several key operating parameters. The panel is divided into four or more sub-panels (depending on the number of circuits in the unit).

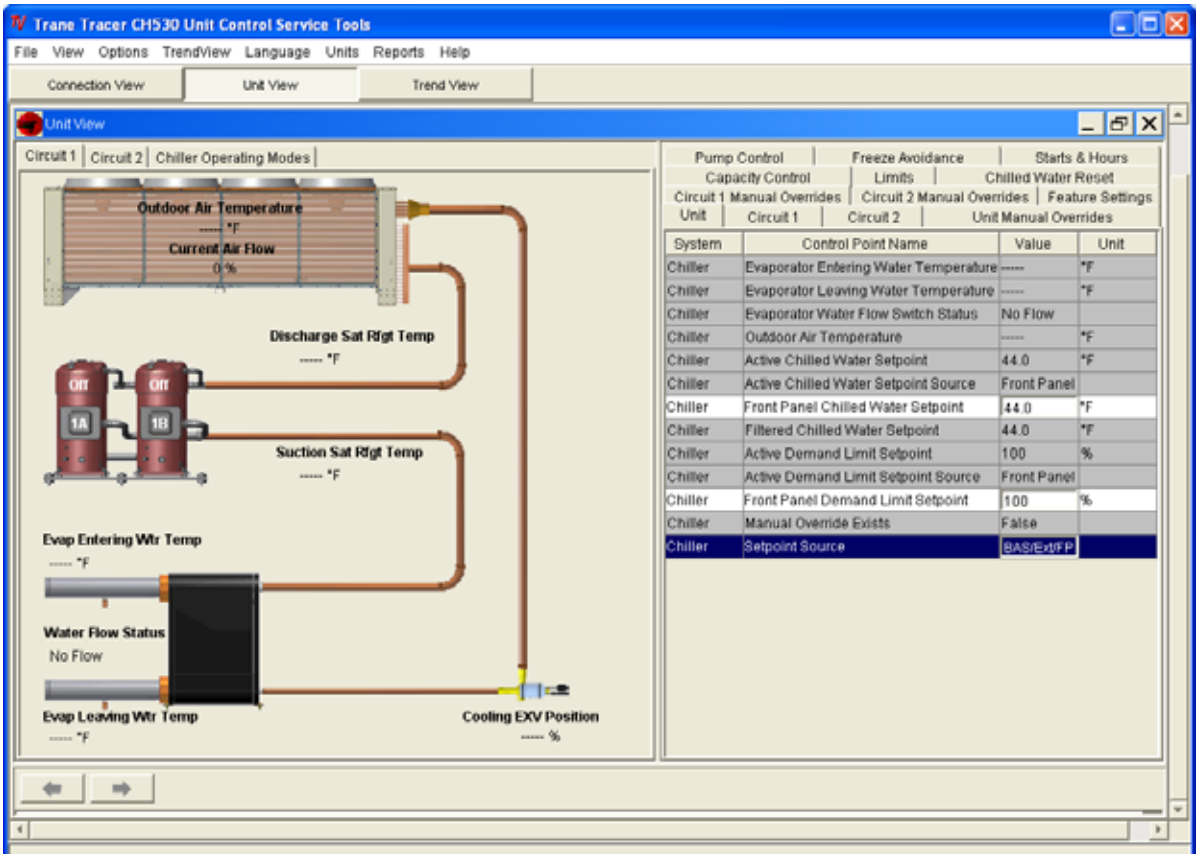
The Operating Mode tab displays the unit, circuit and compressor top level operating modes.

The Hours and Starts tab displays the number a hours (total) a compressor has run and the number of times the compressor has started. This window plays a key role in evaluating maintenance requirements.

Upon successful Local Connect TechView will display UNIT VIEW.

CGAM Unit View is shown below:

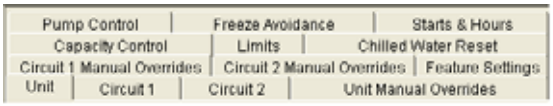
Figure 43 Unit View



The Unit View displays the system, control point name, value and unit of measure. It reflects active setpoints and allows you to make changes.

Unit View also displays, in real time, all non-setpoint data organized by tabs. As data changes on the chiller it is automatically updated in the Unit View.

Figure 44. Unit View Tabs



Circuit/Compressor Lockout

In order to lock out a circuit the user must go to the Unit View/Circuit 1 Manual Overrides Tab and then select the Front Panel Lockout for circuit 1 and/or circuit 2. It is also possible to lockout individual compressors from the same Circuit 1 Manual Overrides Tab in this view.

Diagnostics View

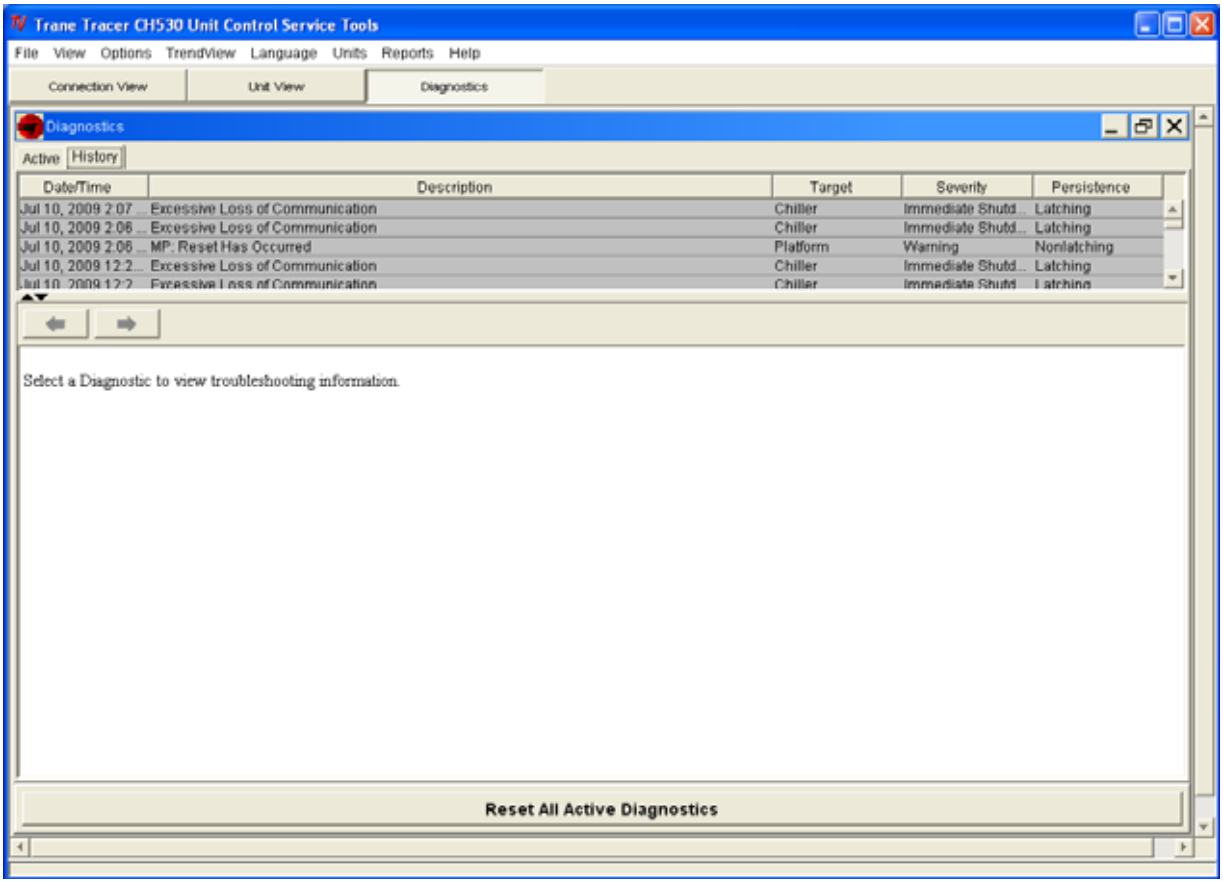
This window lists the active and inactive (history) diagnostics. There can be up to 60 diagnostics, both active and historic. For example, if there were 5 active diagnostics, the possible number of historic diagnostics would be 55. You can also reset active diagnostics here, (i.e., transfer active diagnostics to history and allow the chiller to regenerate any active diagnostics).

Resetting the active diagnostics may cause the chiller to resume operation.

The Active and History diagnostics have separate tabs. A button to reset the active diagnostics displays when either tab is selected.

.

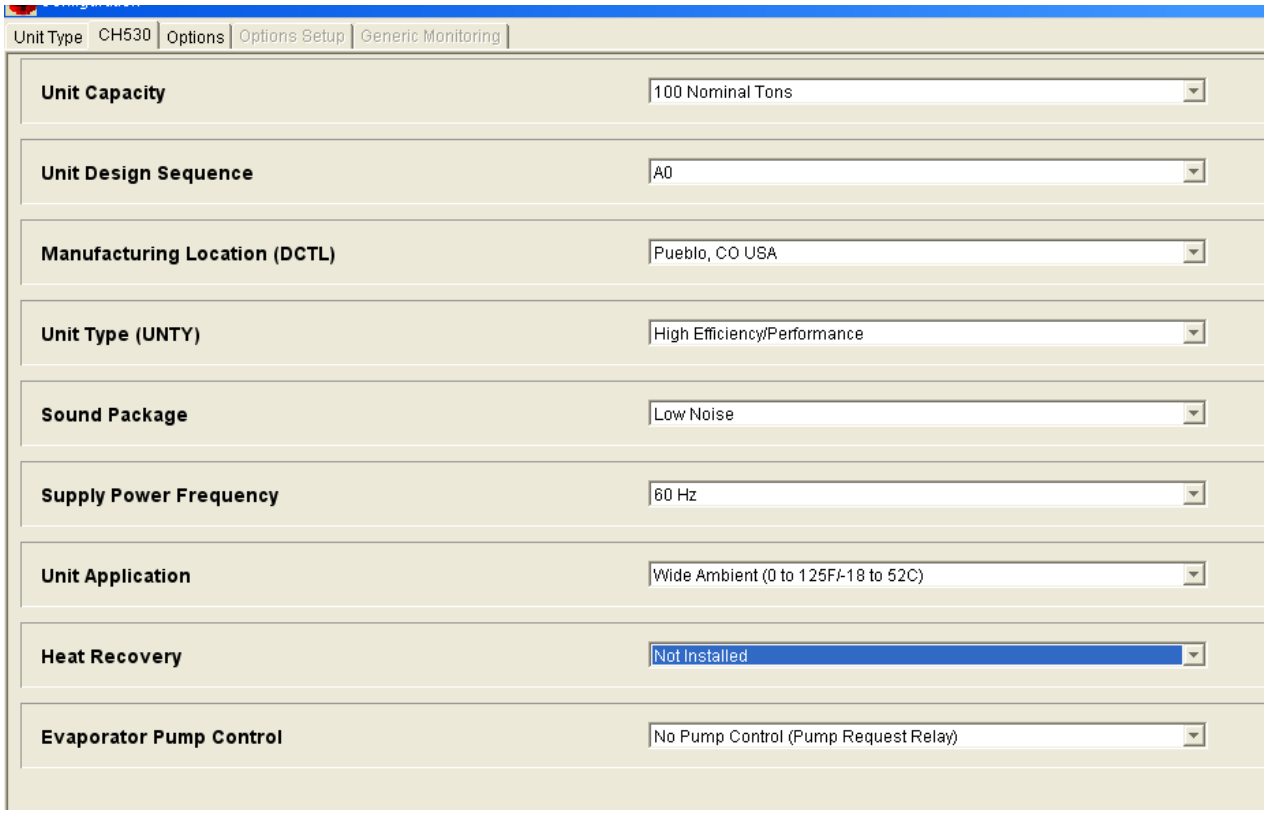
Figure 49 Diagnostic View



Configuration View

This view is under the CH530 tab and displays the active configuration and allows you to make changes to the unit configuration.

Figure 50. Configuration View - CH530 Tab



Configuration View allows you to define the chiller's components, ratings, and configuration settings. These are all values that determine the required installed devices, and how the chiller application is run in the main processor. For example, a user may set an option to be installed with Configuration View, which will require devices to be bound using Binding View. And when the main processor runs the chiller application, the appropriate steps are taken to monitor required inputs and control necessary outputs.

Any changes made in the Configuration View, on any of the tabs, will modify the chiller configuration when you click on the Load Configuration button (located at the base of the window). The Load Configuration button uploads the new configuration settings into the main processor.

Selecting the Undo All button will undo any configuration setting changes made during the present TechView connection and since the last time the Load Configuration button was selected.

Table 42. Configuration View Items - CH530 Tab

Item	Description
Basic Product Line	CGAM - Air-Cooled Scroll Packaged Chiller CXAM - Air-Cooled Scroll Heat Pump (TAI, EPL only)
Unit Capacity	020 Nominal Tons 023 Nominal Tons (TAI, EPL only) 026 Nominal Tons 030 Nominal Tons 035 Nominal Tons 039 Nominal Tons (EPL only) 040 Nominal Tons 045 Nominal Tons (EPL only) 046 Nominal Tons (TAI, EPL only) 052 Nominal Tons 060 Nominal Tons 070 Nominal Tons 080 Nominal Tons 090 Nominal Tons 100 Nominal Tons 110 Nominal Tons 120 Nominal Tons
Unit Design Sequence	Factory Assigned
Manufacturing Location	Epinal, France Pueblo, USA Taicang, China Curitiba, Brazil
Unit Type	Standard Efficiency/Performance (EPL only) High Efficiency/Performance
Sound Package	High Duty (EPL and TAI only) Standard Noise Low Noise
Supply Power Frequency	60 Hz 50 Hz
Unit Application	Standard Ambient (EPL and TAI only) Low Ambient (EPL and TAI only) High Ambient (EPL and TAI only) Wide Ambient
Heat Recovery	No Heat Recovery Partial Heat Recovery w/ Fan Control Partial Heat Recovery w/o Fan Control (EPL and TAI only)
Evaporator Pump Control	No Pump Flow Control Single Pump Fixed Speed (TAI, EPL only) Single Pump Variable Speed (TAI, EPL only) Dual Pump Fixed Speed (TAI, EPL only) Dual Pump Variable Speed

A couple of additional tabs in Configuration View allow you to change other unit configuration options using the Options tab and the Options Setup tab. The features that are installed on the Options Tab will control what is displayed on the Options Setup tab.

Figure 51. Configuration View - Options Tab

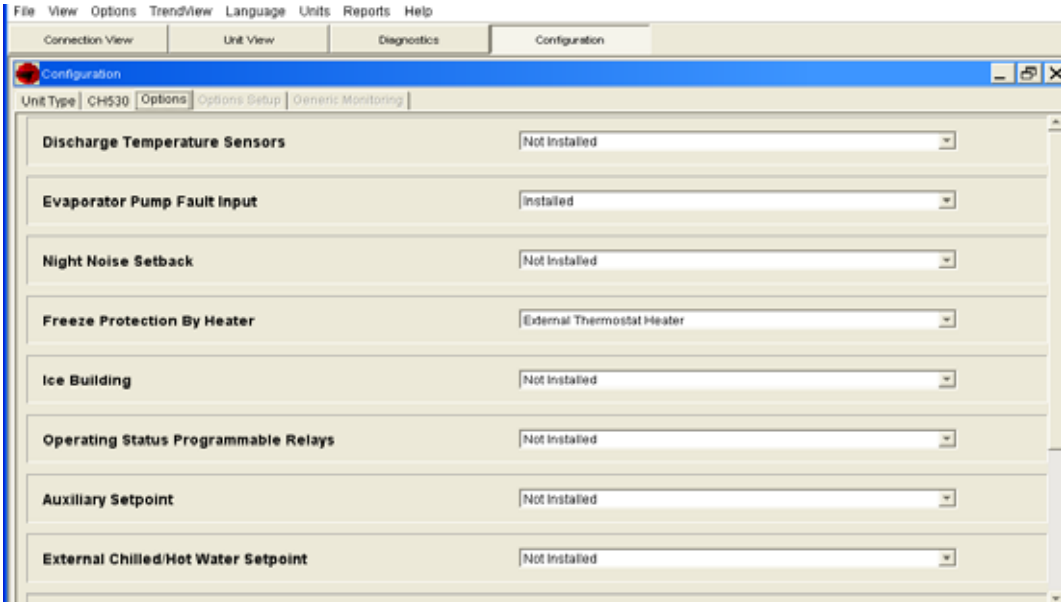


Figure 52. Configuration View - Options Setup Tab

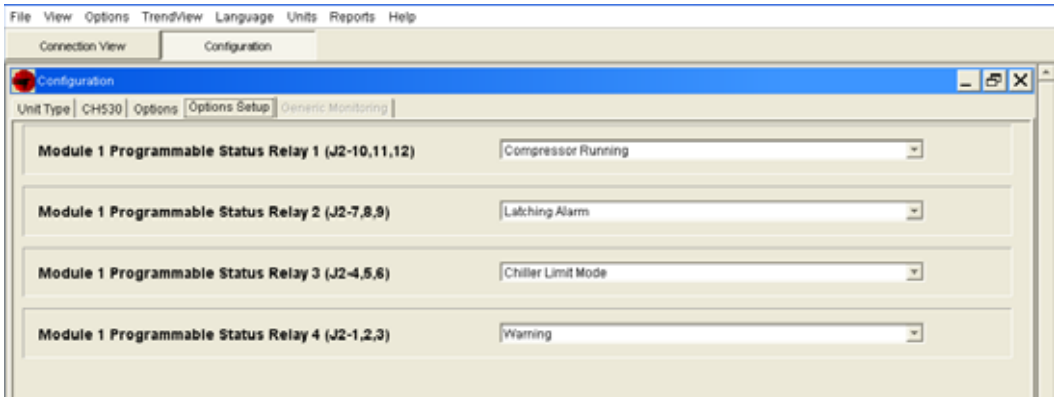
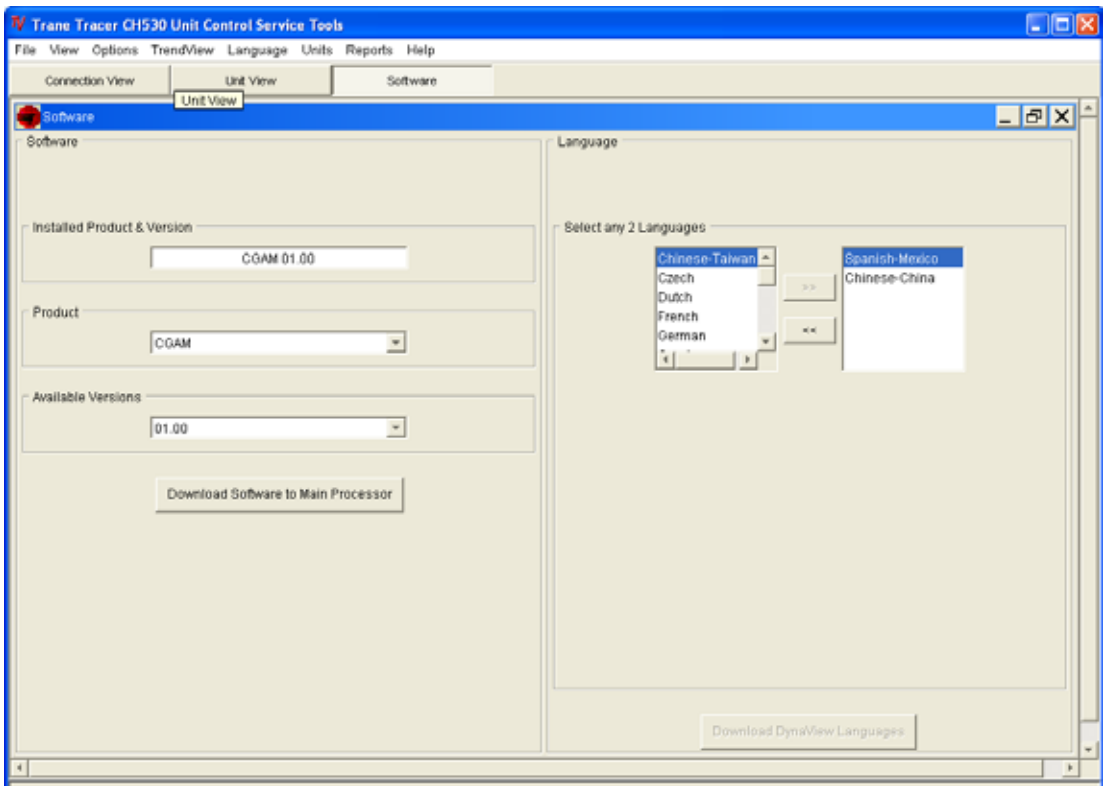


Software View

Software view allows you to verify the version of chiller software currently running on the EasyView or DynaView and download a new version of chiller software to the EasyView or DynaView.

You can also add up to two available languages to load into the DynaView. Loading an alternate language file allows the DynaView to display its text in the selected alternate language, English will always be available.

Figure 53. Software View



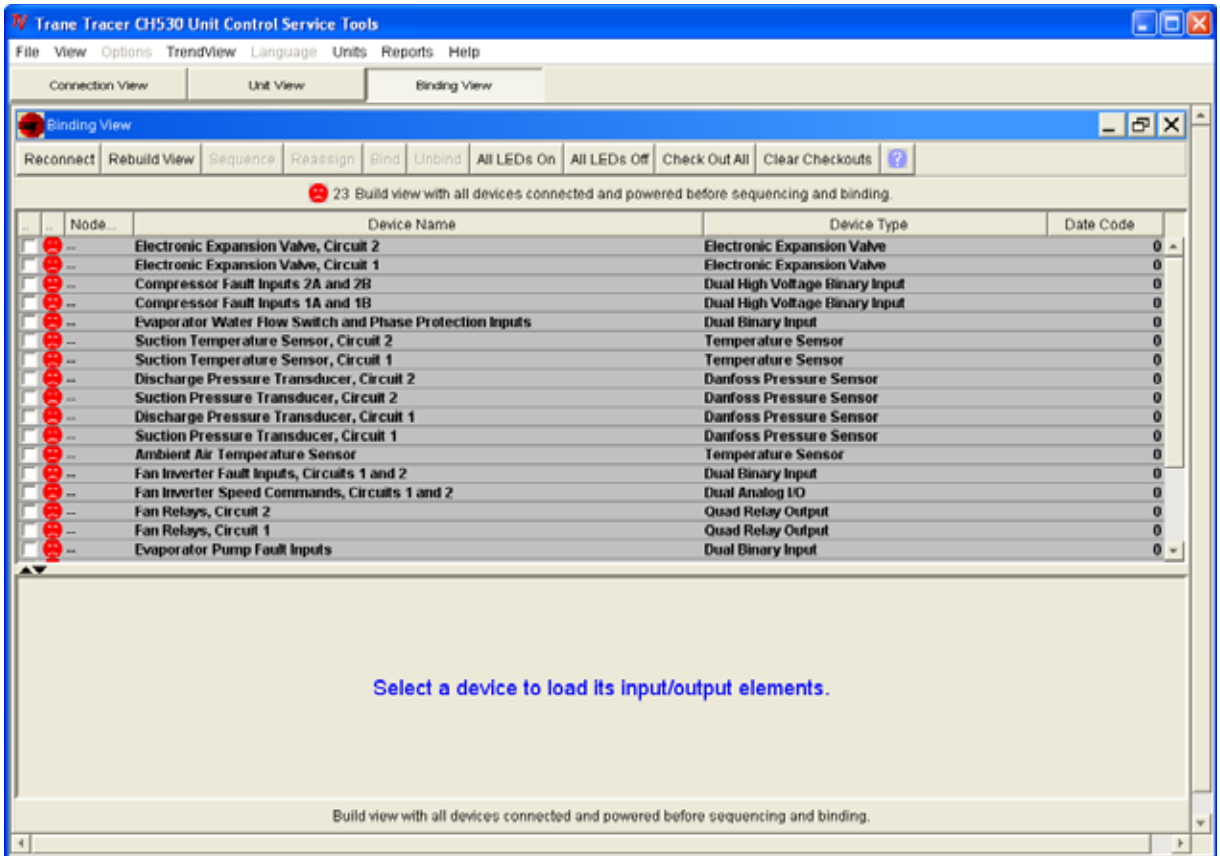
Binding View

Binding View allows you to assess the status of the network and all the devices connected as a whole, or the status of individual devices by using status icons and function buttons.

Binding View is essentially a table depicting what devices and options are actually discovered on the network bus (and their communication status) versus what is required to support the configuration defined by the feature codes and categories. Binding View allows you to add, remove, modify, verify, and reassign devices and options in order to match the configuration requirements.

Whenever a device is installed, it must be correctly configured to communicate and to function as intended. This process is called binding. Some features of Binding View are intended to serve a second purpose; that is diagnosing problems with communication among the devices.

Figure 54. Binding View



Replacing or Adding Devices

If a device is communicating but incorrectly configured, it might not be necessary to replace it. If the problem with the device is related to communication, attempt to rebind it, and if the device becomes correctly configured, it will then communicate properly.

If a device that needs to be replaced is still communicating, it should be unbound. Otherwise, it will be necessary to rebuild the CH530 network image for Binding View to discover that it has been removed. An unbound device stops communicating and allows a new device to be bound in its place.

It is good practice to turn the power off while detaching and attaching devices to the CH530 network. Be sure to keep power on the service tool computer. After power is restored to the CH530 network, the reconnect function in Binding View restores communication with the network. If the service tool computer is turned off, you must restart TechView and Binding View.

If a device is not communicating, the binding function displays a window to request manual selection of the device to be bound. Previously-selected devices are deselected when the function starts. When manual selection is confirmed, exactly one device must be selected; if it is the correct type, it is bound. If the desired device cannot be selected or if multiple devices are accidentally selected, you can close the manual selection window by clicking on No and repeat the bind function.

Pre-Start Checkout

When installation is complete, but prior to putting the unit into service, the following pre-start procedures must be reviewed and verified correct:

⚠ WARNING
Hazardous Voltage!

Disconnect all electric power, including remote disconnects before servicing. Follow proper lockout/tagout procedures to ensure the power can not be inadvertently energized. Failure to disconnect power before servicing could result in death or serious injury

- Inspect all wiring connections to be sure they are clean and tight.
- Verify that all refrigerant valves are "OPEN"

⚠ CAUTION
Compressor Damage!

Do not operate the unit with the compressor, oil discharge, liquid line service valves and the manual shutoff on the refrigerant supply to the auxiliary coolers "CLOSED". Failure to "OPEN" all valves may cause serious compressor damage.

- Check the power supply voltage to the unit at the main power fused-disconnect switch. Voltage must be within the voltage utilization range stamped on the unit nameplate. Voltage imbalance must not exceed 2 percent. Refer to Paragraph.
- Check the unit power phasing to be sure that it has been installed in an "ABC" sequence.

⚠ WARNING
Live Electrical Components!

During installation, testing, servicing and troubleshooting of this product, it may be necessary to work with live electrical components. Have a qualified licensed electrician or other individual who has been properly trained in handling live electrical components perform these tasks. Failure to follow all electrical safety precautions when exposed to live electrical components could result in death or serious injury.

- Fill the evaporator chilled water circuit. Vent the system while it is being filled. Open the vents on the top of the evaporator during filling and close when filling is completed.

⚠ CAUTION
Proper Water Treatment!

The use of untreated or improperly treated water in the CGAM may result in scaling, erosion, corrosion, algae or slime. It is recommended that the services of a qualified water treatment specialist be engaged to determine what water treatment, if any, is required. Trane assumes no responsibility for equipment failures which result from untreated or improperly treated water, or saline or brackish water.

- Close the fused-disconnect switch(es) that supplies power to the chilled water pump starter.

⚠WARNING
Hazardous Voltage!
Disconnect all electric power, including remote disconnects before servicing. Follow proper lockout/tagout procedures to ensure the power can not be inadvertently energized. Failure to disconnect power before servicing could result in death or serious injury.

- Start the chilled water pump to begin circulation of the water. Inspect all piping for leakage and make any necessary repairs.
- With water circulating through the system, adjust water flow and check water pressure drop through the evaporator.
- Prove all Interlock and Interconnecting Wiring Interlock and External.
- Check and set, as required, all CH530 Menu Items.
- Stop the chilled water pump.

Unit Voltage Power Supply

⚠WARNING
Live Electrical Components!
During installation, testing, servicing and troubleshooting of this product, it may be necessary to work with live electrical components. Have a qualified licensed electrician or other individual who has been properly trained in handling live electrical components perform these tasks. Failure to follow all electrical safety precautions when exposed to live electrical components could result in death or serious injury.

Voltage to the unit must meet the criteria given in. Measure each leg of the supply voltage at the unit's main power fused-disconnect. If the measured voltage on any leg is not within specified range, notify the supplier of the power and correct the situation before operating the unit.

⚠ CAUTION
Equipment Damage!
Inadequate voltage to the unit may cause control components to malfunction and shorten the life of relay contact, compressor motors and contactors.

Unit Voltage Imbalance

Excessive voltage imbalance between the phases of a three-phase system can cause motors to overheat and eventually fail. The maximum allowable imbalance is 2 percent. Voltage imbalance is determined using the following calculations:

$$\% \text{ Imbalance} = \frac{(l_x - l_{ave}) \times 100}{l_{ave}}$$

$$V_{ave} = \frac{(V_1 + V_2 + V_3)}{3}$$

$^{1}V_X$ = phase with greatest difference from V_{ave} (without regard to sign)

For example, if the three measured voltages are 221, 230, and 227 volts, the average would be:

$$\frac{221 + 230 + 227}{3} = 226$$

The percentage of imbalance is then:

$$\frac{100(221 - 226)}{226} = 2.2\%$$

This exceeds the maximum allowable (2%) by 0.2 percent.

Unit Voltage Phasing

It is important that proper rotation of the compressors be established before the unit is started. Proper motor rotation requires confirmation of the electrical phase sequence of the power supply. The motor is internally connected for clockwise rotation with the incoming power supply phased A, B, C.

Basically, voltages generated in each phase of a polyphase alternator or circuit are called phase voltages. In a three-phase circuit, three sine wave voltages are generated, differing in phase by 120 electrical degrees. The order in which the three voltages of a three-phase system succeed one another is called phase sequence or phase rotation. This is determined by the direction of rotation of the alternator. When rotation is clockwise, phase sequence is usually called "ABC", when counterclockwise, "CBA".

This direction may be reversed outside the alternator by interchanging any two of the line wires. It is this possible interchange of wiring that makes a phase sequence indicator necessary if the operator is to quickly determine the phase rotation of the motor.

Proper compressor motor electrical phasing can be quickly determined and corrected before starting the unit. Use a quality instrument, such as the Associated Research Model 45 Phase Sequence Indicator.

1. Press the Stop key on the Clear Language Display.
2. Open the electrical disconnect or circuit protection switch that provides line power to the line power terminal block(s) in the starter panel (or to the unitmounted disconnect).

3. Connect the phase sequence indicator leads to the line power terminal block, as follows:

Phase Sea. Lead	Terminal
Black (Phase A)	L1
Red (Phase B)	L2
Yellow (Phase C)	L3

4. Turn power on by closing the unit supply power fused-disconnect switch.
5. Read the phase sequence on the indicator. The "ABC" LED on the face of the phase indicator will glow if phase is "ABC".
6. If the "CBA" indicator glows instead, open the unit main power disconnect and switch two line leads on the line power terminal block(s) (or the unit mounted disconnect). Reclose the main power disconnect and recheck the phasing.

⚠ CAUTION

Equipment Damage!

Do not interchange any load leads that are from the unit contactors or the motor terminals.

7. Reopen the unit disconnect and disconnect the phase indicator.

⚠ WARNING

Hazardous Voltage!

Disconnect all electric power, including remote disconnects before servicing. Follow proper lockout/tagout procedures to ensure the power can not be inadvertently energized. Failure to disconnect power before servicing could result in death or serious injury.

Water System

Flow Rates

Establish a balanced chilled water flow through the evaporator. The flow rates should fall between the minimum and maximum values. Chilled water flow rates below the minimum values will result in laminar flow, which reduces heat transfer and causes either loss of EXV control or repeated nuisance, low temperature cutouts. Flow rates that are too high can cause tube erosion.

Pressure Drop

Measure water pressure drop through the evaporator at the field-installed pressure taps on the system water piping. Use the same gauge for each measurement. Measure flow at the field-installed supply and return. This will include valves, strainers, and fittings in the pressure drop readings.

Pressure drop readings should be approximately those shown in the Pressure Drop Charts in the Installation-Mechanical section.

Start Up Checklist

Figure 55. Start Up Checklist

CGAM Mandatory Start Up Checklist	
******This checklist is not intended to be a substitution for the contractors installation instruction. This checklist is intended to be a guide for the Trane technician just prior to unit 'start-up'. Many of the recommended checks and actions could expose the technician to electrical and mechanical hazards. Refer to the appropriate sections in the unit manual for appropriate procedures, component specifications and safety instructions.***

Unit DL # (special units)	***Date***
Starting Sales Office	***Technician***
Except where noted; it is implied that the technician is to use this checklist for inspection / verification of prior task completed by the general contractor at installation. Use the line item content to also record the associated values onto the Trane unitary packaged equipment log.	*Complete*
1.) Unit clearances adequate for service and to avoid air recirculation etc.	☐
2.) Unit exterior inspected	☐
3.) Crankcase heaters working for **24 hours** prior to arrival of Trane technician performing start up	☐
4.) Correct voltage supplied to unit and electric heaters (imbalance not to exceed 2%)	☐
5.) Unit power phasing (A-B-C sequence) proper for compressor rotation	☐
6.) Copper power wiring meets sizing requirement in job submittal	☐
7.) Unit properly grounded	☐
8.) All automation and remote controls installed/wired	☐
9.) All wiring connections tight	☐
10.) Prove chilled water side Interlock and Interconnecting Wiring Interlock and externals (chilled water pump)	☐
11.) Field installed control wiring landed on correct terminals (external start/stop, emergency stop, chilled water reset...)	☐
12.) Shipping hardware for compressors removed	☐
13.) Verify all refrigerant and oil valves are open/back seated	☐

14.) Compressor oil levels (1/2 -3/4 high in glass) proper	☐
15.) Verify chilled water strainer is clean and free of debris and evaporator chilled water circuits are filled	☐
16.) Close the fused-disconnect switch(es) that supplies power to the chilled water pump starter	☐
17.) Start the chilled water pump to begin circulation of the water. Inspect piping for leaks and repair as necessary	☐
18.) With water circulating through the system, adjust water flow and check water pressure drop through evaporator	☐
19.) Adjust the chilled water flow switch for proper operation	☐
20.) Return chilled water pump to auto	☐
21.) Verify all CH530 Menu Items on DynaView and KestrelView	☐
22.) Fan amperages within nameplate specs	☐
23.) All panels/doors secured prior to start-up	☐
24.) All coil fins inspected and straightened	☐
25.) Rotate fans before starting unit to inspect for potential audible and visual signs of rubbing	☐
Start unit	☐
26.) Press AUTO key. The unit will start if the chiller control calls for cooling and the safety interlocks are closed	☐
27.) Check the EXV sight glasses after sufficient time has elapsed allowing entering and leaving water to stabilize	☐
28.) Check the evaporator and the condenser refrigerant pressure under Refrigerant Report on CH530 TechView	☐
29.) Confirm Superheat and subcooling values are normal	☐
30.) Compressor operation normal and within amperage rating	☐
31.) Operating log completed	☐
32.) Press stop key	☐
33.) Inspect fans again after being under load to ensure no signs or rubbing exist	☐
34.) Verify the chilled water pump runs for at least 1 minute after the chiller is commanded to stop (for normal chilled water systems)	☐

Unit Start-Up Procedures

Sequence of Operation

Power Up

The Power up chart shows the respective DynaView screens during a power up of the main processor. This process takes from 30 to 45 seconds depending on the number of installed Options. On all power ups, the software model will always transition through the 'Stopped' Software state independent of the last mode. If the last mode before power down was 'Auto', the transition from 'Stopped' to 'Starting' occurs, but it is not apparent to the user.

Figure 56. Power Up

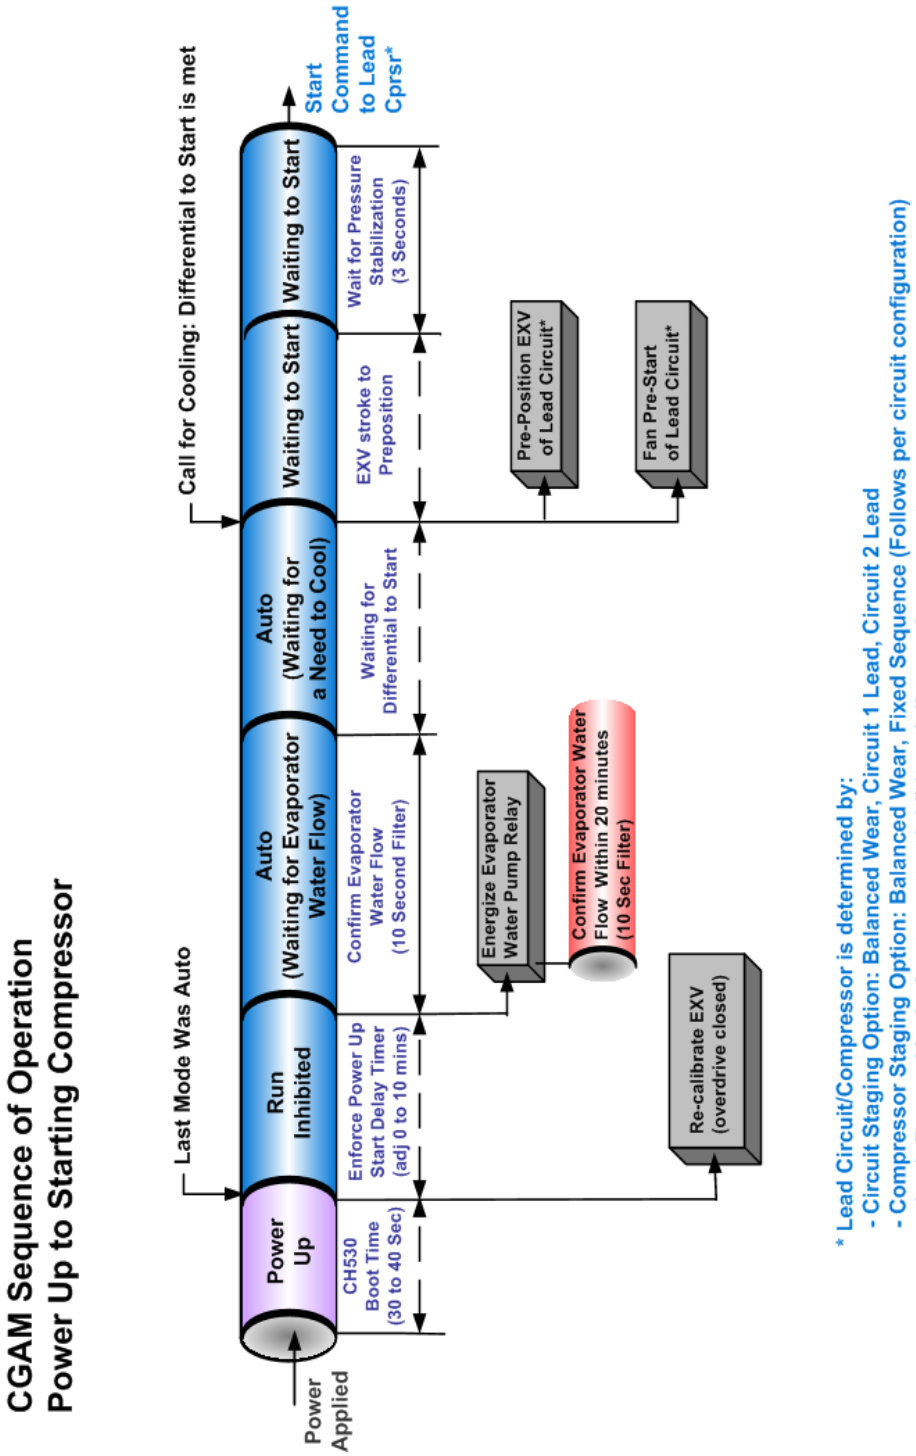
Power Up to Starting

The Power up to starting diagram shows the timing from a power up event to energizing the compressor. The shortest allowable time would be under the following conditions:

1. No motor restart inhibit
2. Evaporator Water flowing
3. Power up Start Delay setpoint set to 0 minutes
4. Adjustable Stop to Start Timer set to 5 seconds
5. Need to cool

The above conditions would allow for a minimum power up to starting compressor time of 95 seconds.

Figure 57. Power Up to Starting



Stopped to Starting:

The stopped to starting diagram shows the timing from a stopped mode to energizing the compressor. The shortest allowable time would be under the following conditions:

1. No motor restart inhibit
2. Evaporator Water flowing
3. Power up Start Delay Timer has expired
4. Adjustable Stop to Start Timer has expired
5. Need to cool

The above conditions would allow the compressor to start in 60 seconds.

⚠ CAUTION
Refrigerant!

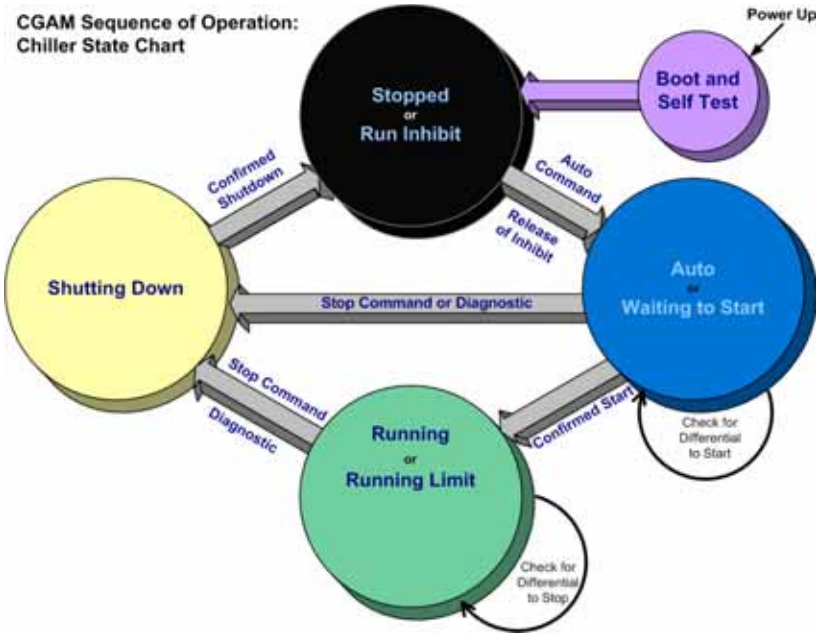
If both suction and discharge pressures are low but sub-cooling is normal, a problem other than refrigerant shortage exists. Do not add refrigerant, as this may result in overcharging the circuit.

Use only refrigerants specified on the unit nameplate (R-410A) and Trane OIL00079 (1 quart) or OIL00080 (1 gallon). Failure to do so may cause compressor damage and improper unit operation.

⚠ CAUTION
Equipment Damage!

Ensure that the oil sump heaters have been operating for a minimum of 24 hours before starting. Failure to do so may result in equipment damage.

Figure 58. Chiller State Chart



Start-Up

⚠ CAUTION
Equipment Damage!

Ensure that the oil sump heaters have been operating for a minimum of 24 hours before starting. Failure to do so may result in equipment damage.

If the pre-start checkout, has been completed, the unit is ready to start.

1. Press the STOP key on the CH530.
2. As necessary, adjust the setpoint values in the CH530 menus using TechView.
3. Close the fused-disconnect switch for the chilled water pump. Energize the pump(s) to start water circulation.
4. Check the service valves on the discharge line, suction line, oil line and liquid line for each circuit. These valves must be open (backseated) before starting the compressors.

⚠ CAUTION
Compressor Damage!

Catastrophic damage to the compressor will occur if the oil line shut off valve or the isolation valves are left closed on unit start-up.

5. Press the AUTO key. If the chiller control calls for cooling and all safety interlocks are closed, the unit will start. The compressor(s) will load and unload in response to the leaving chilled water temperature.
6. Verify that the chilled water pump runs for at least one minute after the chiller is commanded to stop (for normal chilled water systems).

Note: Once the system has been operating for approximately 30 minutes and has become stabilized, complete the remaining start-up procedures, as follows:

7. Check the evaporator refrigerant pressure and the condenser refrigerant pressure under Refrigerant Report on the CH530 TechView. The pressures are referenced to sea level (14.6960 psia).
8. Check the EXV sight glasses after sufficient time has elapsed to stabilize the chiller. The refrigerant flow past the sight glasses should be clear. Bubbles in the refrigerant indicate either low refrigerant charge or excessive pressure drop in the liquid line or a stuck open expansion valve. A restriction in the line can sometimes be identified by a noticeable temperature differential between the two sides of the restriction. Frost will often form on the line at this point. Proper refrigerant charges are shown in the General Data tables.

Note: Important! A clear sight glass alone does not mean that the system is properly charged. Also check system subcooling, liquid level control and unit operating pressures.

9. Measure the system subcooling.
10. A shortage of refrigerant is indicated if operating pressures are low and subcooling is also low. If the operating pressures, sight glass, superheat and subcooling readings indicate a refrigerant shortage, gas-charge refrigerant into each circuit, as required. With the unit running, add refrigerant vapor by connecting the charging line to the suction service valve and charging through the backseat port until operating conditions become normal.

Print out a Chiller Service Report from TechView to file a start-up claim and to keep for reference with the chiller.

Seasonal Unit Start-Up Procedure

1. Close all valves and re-install the drain plugs in the evaporator and condenser heads.
2. Service the auxiliary equipment according to the start-up/maintenance instructions provided by the respective equipment manufacturers.
3. Vent and fill the cooling tower, if used, as well as the condenser and piping. At this point, all air must be removed from the system (including each pass). Close the vents in the evaporator chilled water circuits.
4. Open all the valves in the evaporator chilled water circuits.
5. If the evaporator was previously drained, vent and fill the evaporator and chilled water circuit. When all air is removed from the system (including each pass), install the vent plugs in the evaporator water boxes.

⚠ CAUTION

Equipment Damage!

Ensure that the oil sump heaters have been operating for a minimum of 24 hours before starting. Failure to do so may result in equipment damage.

⚠ CAUTION

Compressor Damage!

Catastrophic damage to the compressor will occur if the oil line shut off valve or the isolation valves are left closed on unit start-up.

Limit Conditions

CH530 will automatically limit certain operating parameters during startup and run modes to maintain optimum chiller performance and prevent nuisance diagnostic trips. These limit conditions are noted in Figure 43, p. 129.

Table 43. Limit Conditions

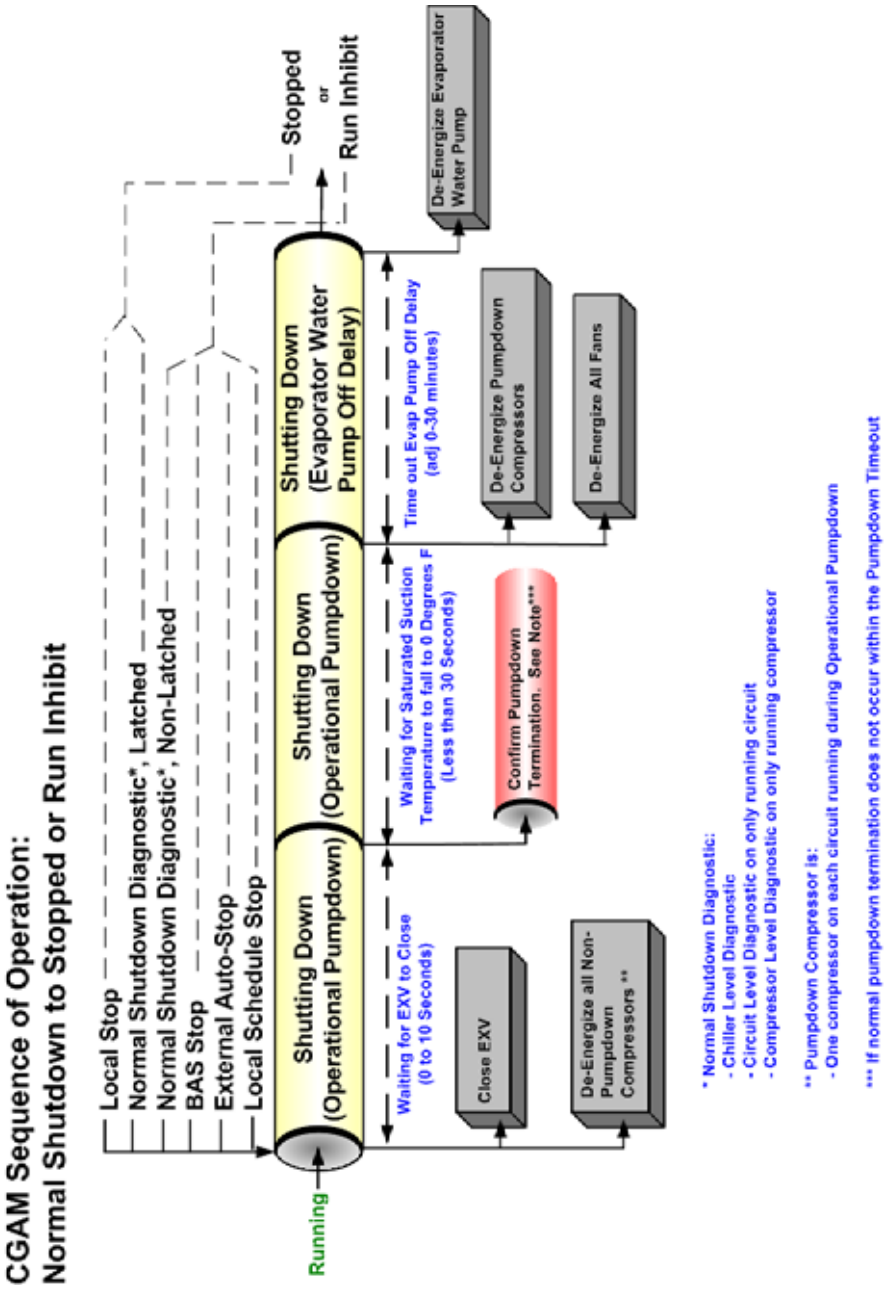
Running - Limited	The chiller, circuit, and compressor are currently running, but the operation of the chiller/compressor is being actively limited by the controls. Further information is provided by the sub-mode.
Capacity Limited by High Cond Press	The circuit is experiencing condenser pressures at or near the condenser limit setting. The compressor will be unloaded to prevent exceeding the limits.
Capacity Limited by Low Evap Rfgt Temp	The circuit is experiencing saturated evaporator temperatures at or near the Low Refrigerant Temperature Cutout setting. The compressors will be unloaded to prevent tripping.

Unit Shutdown

Normal Shutdown to Stopped

The Normal Shutdown diagram shows the Transition from Running through a Normal (friendly) Shutdown. The Dashed lines on the top attempt to show the final mode if you enter the stop via various inputs.

Figure 59. Normal Shutdown



Seasonal Unit Shutdown

1. Perform the normal unit stop sequence using the <Stop> key.

Note: Do not open the starter disconnect switch. This must remain closed to provide control power from the control power transformer to the oil heaters.

2. Verify that the chilled water and condenser water pumps are cycled off. If desired, open the disconnect switches to the pumps.
3. Drain the condenser piping and cooling tower, if desired.
4. Remove the drain and vent plugs from the condenser headers to drain the condenser.
5. Verify that the oil heaters are working.
6. Once the unit is secured, perform the maintenance identified in the following sections.

Maintenance

Periodic Maintenance

General

Perform all maintenance procedures and inspection at the recommended intervals. This will prolong the life of the chiller and minimize the possibility of malfunctions.

Use an "Operator's Log" to record the unit's operating history. The log serves as a valuable diagnostic tool for service personnel. By observing trends in operating conditions, an operator can anticipate and prevent problem situations before they occur.

If the unit is not operating properly during maintenance inspections, consult the "Diagnostic and Troubleshooting" section of this manual.

Weekly Maintenance

After the chiller has been operating for approximately 30 minutes and the system has stabilized, check the operating pressures and temperatures and complete the following checks:

Check the evaporator and condenser refrigerant pressures in the Refrigerant Report menu of the CH530 display. Pressures are referenced at sea level (14.6960 psia).

Check the electronic expansion valve sight glasses. (Note: The electronic expansion valve is commanded closed at unit shutdown and if the unit is off, there will be no refrigerant flow through the sight glasses. Only when a circuit is running will refrigerant flow be present.) The refrigerant flow through the sight glasses should be clear. Bubbles in the refrigerant indicate either low refrigerant charge or excessive pressure drop in the liquid line. A restriction in the line can sometimes be identified by a noticeable temperature differential between the two sides of the restriction. Frost may often form on the liquid line at this point. Correct refrigerant charges are shown in the General Data Tables.

NOTICE: A clear sight glass alone does not mean that the system is properly charged. Also check the system superheat, subcooling and unit operating pressures.

NOTICE: Use only manifold gauge sets designed for use with R-410A refrigerant. Use only recovery units and cylinders designed for the higher pressure of R-410A refrigerant and POE oil.

NOTICE: R-410A must be charged in a liquid state.

Check the system superheat, subcooling, evaporator temperature drop (Delta-T), evaporator water flow, evaporator approach temperature, compressor discharge superheat, and compressor RLA.

Normal operating conditions at ARI Conditions are:

- Evaporator pressure: 120 psig
- Evaporator Approach: 5-10 F
- Evaporator Superheat: 12 F
- Electronic Expansion Valve: 40-50 percent open
- Evaporator Temperature Drop (Delta-T): 10 F
- Compressor Discharge Temperature: 63 F or more
- Condensing Pressure: 420-440 psig
- Condensing Approach Temperature: 25 F
- System Subcooling: 15-20 F
- Compressor RLA: 100 percent

If operating pressures and sight glass conditions seem to indicate a refrigerant shortage, measure the system superheat and subcooling. Refer to "System Superheat" and "System Subcooling."

If operating conditions indicate a refrigerant overcharge, remove refrigerant at the liquid line service valve. Allow refrigerant to escape slowly to minimize oil loss. Use a refrigerant recovery cylinder and do not discharge refrigerant into the atmosphere.

⚠ WARNING: Do not allow refrigerant to directly contact skin as injury from frostbite may result.

Inspect the entire system for unusual conditions and inspect the condenser coils for dirt and debris. If the coils are dirty, refer to "Coil Cleaning" in this manual.

Monthly Maintenance

Complete all weekly maintenance procedures.

Measure and record the evaporator superheat. Refer to "Evaporator Superheat."

Measure and record the system subcooling. Refer to "System Subcooling."

Manually rotate the condenser fans to ensure that there is proper clearance on the fan shroud openings.

⚠ WARNING: Position all electrical disconnects in the "OPEN" position and lock them to prevent injury of death due to electrical shock or moving parts.

Annual Maintenance

Complete all weekly and monthly maintenance checks.

Check the oil level and refrigerant charge. Routine changing of oil is not required.

Have a qualified laboratory perform a compressor oil analysis to determine system moisture content and acid level. This analysis is a valuable diagnostic tool.

Contact a qualified service provider to leak test the chiller, check operating and safety controls, and to inspect electrical components for proper operation. Leak testing my be accomplished using soap solution or with electronic or ultrasonic leak detectors.

Inspect all piping components for leaks and damage. Clean all water strainers.

NOTICE: If the CGAM chiller evaporator or evaporator water piping is drained of water, the evaporator immersion heater must be de-energized. Failure to de-energize the heater will cause it to burn out.

Clean and repaint any components that show corrosion.

Clean the condenser coils. Refer to "Coil Cleaning" in this manual.

⚠ WARNING: Position all electrical disconnects in the "OPEN" position and lock them to prevent injury of death due to electrical shock or moving parts.

Clean the condenser fans. Check the fan assemblies for proper clearance in the fan shroud openings and for motor shaft misalignment or abnormal end-play, vibration and noise.

Compressor Service Information

Compressor Electrical Connections

It is very important that CSHD compressors used in Trane Model CGAM chillers are wired correctly for proper rotation. These compressors will not tolerate reverse rotation. Verify correct rotation/phasing using a rotation meter. Proper phasing is clockwise, A-B-C. If wired incorrectly a CSHD compressor will make excessive noise, will not pump and will draw about half the normal current. It will also become very hot if allowed to run for an extended period.

NOTICE: Do not "bump" the compressor to check rotation as incorrect rotation could cause compressor motor failure in as little as 4 to 5 seconds!

It is also very important that CSHN compressors used in Trane Model CGAM chillers are wired correctly for proper rotation. Correct rotation of CSHN compressors is also clockwise, with A-B-C phasing. Improper rotation of the CSHN compressors is indicated by a compressor module trip, noisy operation, no pressure difference on manifold gauges and low amp draw.

Oil Level

Oil should also be visible in the sight glass when the compressor is running. When operating, each compressor in a tandem or trio set may have a different oil level.

To check compressor oil level, refer to the label near the compressor sight glass. The compressor(s) must be off. Wait three minutes. With tandem or triple compressors the oil level will equalize after shutdown. Compressor oil level should be clearly visible within the sight glass when the compressors are off.

Oil Fill, Removal and Capacity

The Model CSHN compressors have an oil charging valve with a dip tube that goes to the bottom of the compressor. This can be used to add or remove oil from the compressor.

Model CSHD compressors have a Schrader valve in the middle of the compressor which is used to add oil. To remove oil from these compressors, the system refrigerant charge must be removed and then the oil can be removed using a suction style hand pump and tube in the oil equalizer tube fitting. Oil can also be added to these compressors through the oil equalizer tube fitting. Care must be taken to prevent moisture from entering the system when adding oil.

Compressor Oil Capacity

CSHD 125, 161 — 7 Pints

CSHN 184 —14.2 Pints

CSHN 250 —15.2 Pints

CSHN 315 —16.2 Pints

CSHN 374 —17.2 Pints

Use only Trane OIL00079 (1 quart) or OIL00080 (1 gallon). These are the same oil, but different container sizes. Do not use any other POE oil.

NOTICE: Never reuse oil.

Oil Testing

Use Trane Oil Testing Kit KIT06815 only for testing lubricating oil in the Model CGAM chiller. Note that the POE oil used in this product is very hygroscopic and easily absorbs and retains moisture. The acceptable moisture content is less than 100 ppm and acceptable acid level is less than 0.5 TAN. Note that refrigerant and moisture is very

difficult to remove from this oil using vacuum. Also note that once the seal on a container of POE oil is opened, the oil must be used.

In the event of a compressor failure, always test the oil with an acid test kit to determine whether the compressor failure was mechanical or electrical. This is important because it dictates correct cleanup procedure.

Compressor Operational Pump Down

The operational pump down is used to manage the refrigerant charge and prevent liquid slugging into the compressors, oil dilution and oil starvation. The pump down will be completed by the last operating compressor in the refrigerant circuit and occurs during normal shutdown conditions. The electronic expansion valve will close.

The operational pump down sequence will end when:

- Saturated evaporator temperature drops below the operational pump down set point
- Compressor pressure differential exceeds 348 psid (Condensing Pressure - (Evaporator Pressure x 2.9)
- When the operational pump down time expires (60 x (100/circuit capacity %))
- An immediate shutdown diagnostic occurs
- A pressure transducer fails

Compressor Service Pump Down Procedure

The Service Pump down procedure is used to store the Model CGAM refrigerant in the condenser. The condenser is sized to hold the entire refrigerant charge.

Procedure:

- Select compressor to use for pump down.
- All chiller safeties remain in effect.
- Evaporator water flow must be proven
- Condenser fans operate normally
- Manually close refrigerant liquid line service valve

Service pump down is complete when:

- Service pump down time expires (60 x (100/circuit capacity %))
- Saturated evaporator pressure falls below Low Pressure Cutout x1.15 for one second

After pump down terminates, the MP automatically puts circuit into lockout. Pump down can also be terminated by “Abort Pump down” in service tool, an immediate shutdown diagnostic occurs or a pressure transducer fails.

Oil Equalizer Line

CSHN Compressors.

The oil equalizer line is equipped with a Rotolock fitting for easy removal. Torque values for tightening these fitting is 100 ft.-lbs, plus or minus 10 ft. lbs.

Drain the oil to a level below the oil equalizer tube fitting before removing the oil equalizer line. This must be done on both compressors. Use the oil drain valve on the compressor. If the oil is drained below the level of the oil level sight glass, it will be below the oil equalizer line level. Pressurize the low side of the compressor using nitrogen to help drain the oil. No more than 10 psig of pressure will be needed.

CSHD Compressors.

CSHD compressors do not have an oil drain valve. Therefore, before removing the oil equalizer line, the system refrigerant charge must be recovered before draining the oil. Use a catch pan to catch the oil when the compressor oil equalizer line is loosened to ensure that oil does not spill out of the compressor when the equalizer line is removed. The torque value for the Rotolock fitting on CSHD compressors is 64 ft.-lbs., plus or minus 2 ft.-lbs.

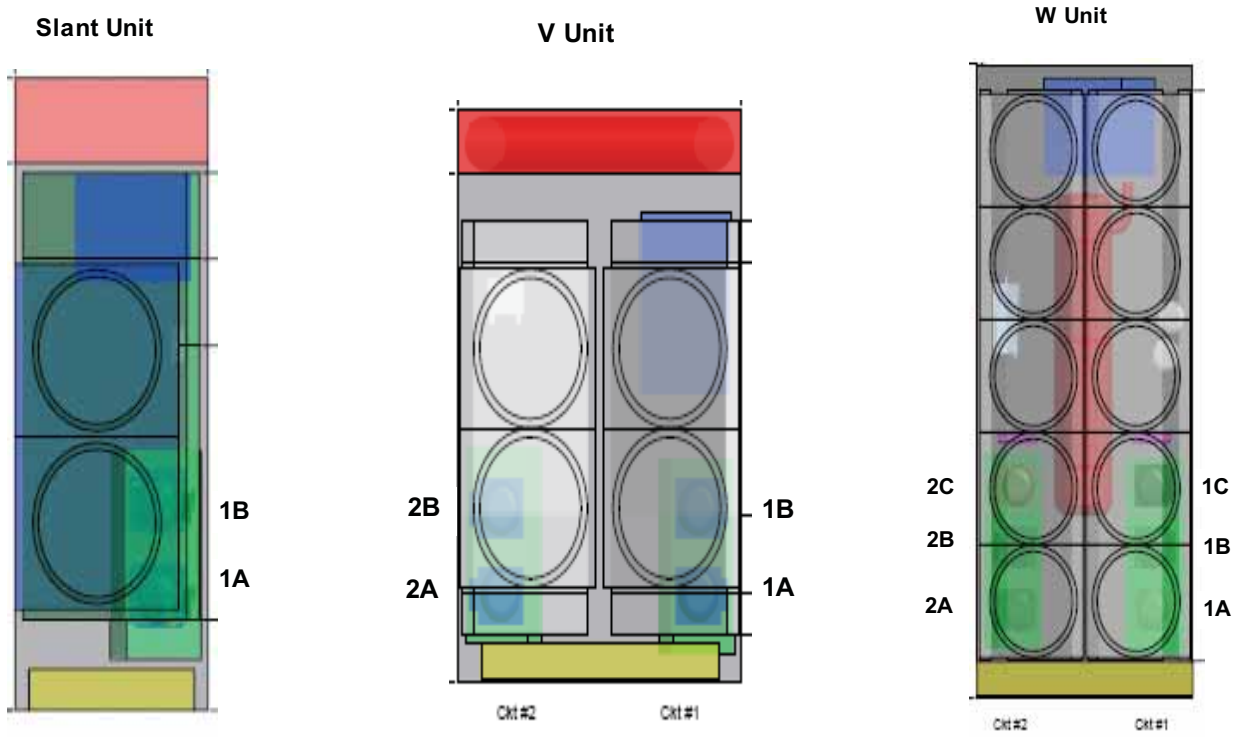
Tandem Compressor Suction Restrictors

Since most tandem compressor sets use unequal size compressors, these combinations require the use of a restrictor in the suction line of one or more compressors in order to provide correct oil level balance between compressors when they are operating. See the table below for correct restrictor applications. A figure showing where compressors are installed in the different units is also shown.

Table 44. Compressor Manifold Order

Unit Nominal Size (tons)	Compressor Size 1A	1B	2A	2B	Restrictor Size mm	Location
020	10	10	N/A		N/A	
023	10	13			25/23	1A
026	13	13			N/A	
030	15	15			N/A	
035	15	20			31	1A
039	20	20			N/A	
045	20	25			31	1A
050	25	25			N/A	
040	10	10	10	10	N/A	
046	10	13	13	10	25/23	1A & 2B
052	13	13	13	13	N/A	
060	15	15	15	15	N/A	
070	15	20	20	15	31	1A & 2B
080	20	20	20	20	N/A	
090	20	25	25	20	31	1A & 2B
100	25	25	25	25	N/A	
110	25	30	30	25	31	1A & 2B
120	30	30	30	30	N/A	

Table 45. Compressor Locations



Compressor Replacement

If the CGAM chiller suffers a failed compressor, use these steps for replacement:

Each compressor has lifting eyes. Both lifting eyes must be used to lift the failed compressor. DO NOT LIFT A COMPRESSOR USING A SINGLE LIFTING EYE. Use proper lifting techniques, a spreader bar and rigging as for lifting both compressors simultaneously.

Compressor weights by compressor model are:

- CSHD 125 - 142 lbs.
- CSHD 161 - 155 lbs.
- CSHN 184 - 234 lbs.
- CSHN 250 - 238 lbs.
- CSHN 315 - 337 lbs.
- CSHN 374 - 362 lbs.

After a mechanical failure of a compressor, it is necessary to change the oil in the remaining compressor and also replace the liquid line filter drier. After an electrical failure of a compressor, it will also be necessary to change the oil in the remaining compressor, replace the liquid line filter drier and add a suction filter drier with clean-up cores.

Note: Do not alter the refrigerant piping in any way as this can affect compressor lubrication.

Note: Do not add a filter drier within 10 inches of the elbow for CSHD compressors, or within 16 inches of the elbow for CSHN compressors.

Refrigerant System Open Time

Model CGAM chillers use POE oil and therefore refrigerant system open time must be kept to a minimum. The following procedure is recommended:

Leave a new compressor sealed until it is ready to be installed in the unit. Maximum system open time is dependent upon ambient conditions, but do not exceed one hour open time.

Plug the open refrigerant line to minimize moisture absorption.

Always change the liquid line filter drier.

Evacuate the system to 500 microns or below.

Do not leave POE oil containers open to the atmosphere. Always keep them sealed.

Mechanical Compressor Failure

Replace the failed compressor(s) and change the oil in the remaining compressor(s) along with the refrigerant system liquid line filter drier.

Electrical Compressor Failure

Replace the failed compressor and change the oil in the other compressor(s). Also add a suction filter with cleanup cores and change the liquid line filter drier. Change filters and oil until the oil no longer test acidic. See “Oil Testing.”

Compressor Motor Megging

Motor megging determines the electrical integrity of the compressor motor winding insulation. Use a 500 volt megger. A less than 1 meg-ohm reading is acceptable and 1000 ohms per nameplate volts is required to safely start the compressor.

Compressor Current Imbalance

Normal current imbalance could be 4 to 15 percent with balanced voltage due to motor design. Each phase should register 0.3 to 1.0 ohms and each phase should be within 7 percent of the other two phases. Phase to ground resistance must be infinity.

NOTICE: Maximum allowable voltage imbalance is 2 percent.

Refrigerant Piping

The compressor suction and discharge lines are copper. In most instances, piping may be reused. If piping is not reusable, order the correct service parts. Cut all tubing with a tubing cutter to prevent copper filings from entering the system. Cut the tubing in a straight length of pipe after the compressor connection has been unsweated. The line can then be reinstalled using a slip coupling and brazing.

NOTICE: The compressor suction line configuration must not be changed in any way. Changing compressor suction line configuration will compromise proper oil return to the compressor(s).

Compressor Electrical Terminal Box

Be sure to protect the terminal box when unbrazing or brazing compressor refrigerant piping connections

Compressor Crankcase Heaters

Compressor crankcase heaters must be energized at least eight hours before starting the CGAM chiller. This is required to boil refrigerant out of the oil before startup. Ambient temperature is not a factor and the crankcase heaters must always be energized prior to startup.

Condenser Maintenance

Condenser Coil Cleaning

Clean the condenser coils at least once a year or more frequently if the unit is in a “dirty” environment. A clean condenser coil will help to maintain chiller operating efficiency. Follow the detergent manufacturer's instructions to avoid damaging the condenser coils.

To clean the condenser coils use a soft brush and a sprayer such as a garden pump type or a high-pressure type. A high quality detergent such as Trane Coil Cleaner (Part No. CHM-0002) is recommended.

Note: If detergent mixture is strongly alkaline (pH value greater than 8.5, an inhibitor must be added).

Evaporator Maintenance

NOTICE:
The factory-installed immersion heater must be de-energized if the BPHE evaporator is drained of water for any reason. Failure to de-energize the immersion heater will cause it to burn out.

The Trane Model CGAM liquid chiller uses a brazed plate heat exchanger (BPHE) evaporator with factory-installed electronic flow switch (IFM efector) that is positioned in the evaporator water pipe. The evaporator inlet also includes a factory-installed immersion heater for freeze protection and a water strainer that must be kept in place to keep debris out of the evaporator.

Note: Strainer maintenance is critical to proper operation and reliability. Any particles larger than 1mm entering the BPHE evaporator may cause the evaporator to fail, requiring replacement.

Acceptable BPHE evaporator water flow rate is 1.5 to 3.6 GPM per nominal unit ton capacity. To maintain 54-44 F in/out chilled water temperatures, the nominal water flow rate is 2.4 GPM per ton.

Minimum water flow rate must be maintained to avoid laminar flow, potential evaporator freezing, scaling and poor temperature control. The microprocessor and capacity control algorithms are designed to take a 10 percent change in water flow rate per minute while maintaining a ±2°F (1.1°C) leaving water temperature control accuracy. The chiller tolerates up to 30 percent per minute water flow variation as long as the flow is equal to or greater than minimum flow requirements.

Maximum water flow is 18 feet per second. Flow rates greater than this will cause excessive erosion.

The BPHE evaporator is difficult to clean should it become plugged with debris. Indications of a plugged BPHE evaporator include “wet” suction due to lack of heat exchange, loss of superheat control, depressed discharge superheat (superheat less than 63°F), compressor oil dilution and/or starvation and premature compressor failure.

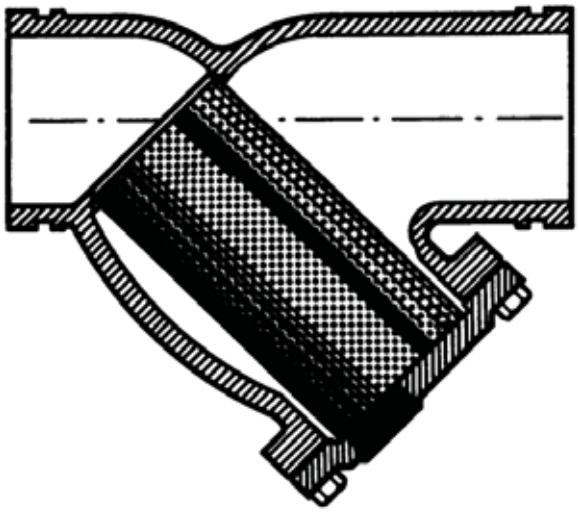
Evaporator Replacement

If the CGAM evaporator requires replacement, it is very important that the new evaporator be replaced correctly and with the correct refrigerant and water piping connections. The refrigerant inlet/liquid connection is at the bottom of the evaporator and the refrigerant outlet/suction connection is at the top of the evaporator and both are on the same side. Pay particular attention to evaporators with dual circuits. Avoid cross-circuiting when installing the new evaporator.

Water Strainer Maintenance

Factory-installed water strainer is a Y-type design. The stainer is equipped with a blow-down valve. The strainer is a 16 mesh (approximately 1 mm) material.

Figure 60. Water Strainer - Y type



For maximum efficiency, a differential pressure gauge installed across the inlet and outlet will indicate pressure loss due to clogging and may be used as a guide to determine when cleaning is required. The taps for the pressure gauges are included as standard from the factory.

Normally when differential pressure reaches 5-10psi, the screen must be cleaned. The strainer is equipped with a blow-down valve on the cover plate. To clean open and flush out until any sediment is removed.

Diagnostics

Explanatory Comments

Diagnostic Text:

Black text is intended for use on TechView. It has no intrinsic length limit. It should contain few or no abbreviations.

Blue (italicized) *text is intended for use on DynaView. It has a 40 character length limit for English and other European languages, based on 8 pixel character width (DynaView's display is 320 pixels wide). The text should be abbreviated as necessary to meet the length limit. Trane standard abbreviations or ASME standard abbreviations (ASME Y14.38-1999 or later) should be used wherever possible.*

Orange (underlined) text is intended for use on LCI-C. LCI-C has a 28 character length limit for English and other European languages, based on one character per byte (LCI-C diagnostic text has a 28 byte limit). It should be abbreviated as necessary to meet the length limit. Trane standard abbreviations or ASME standard abbreviations (ASME Y14.38-1999 or later) should be used wherever possible. "Comm:" is the standard abbreviation for "Comm Loss:" in order to leave enough space for the rest of the diagnostic text.

Legacy Hex Code: Three digit hexadecimal code used on all past products to uniquely identify diagnostics.

Diagnostic Name and Source: Name of Diagnostic and its source. Note that this is the exact text used in the User Interface and/or Service Tool displays.

The following codes were added to cover the unmapped diagnostics:

6B6	Unknown Chiller Diagnostic
6B7	Unknown Compressor Diagnostic

Affects Target: Defines the "target" or what is affected by the diagnostic. Usually either the entire **Chiller**, or a particular **component** is affected by the diagnostic (the same one as the source), but in special cases functions are modified or disabled by the diagnostic. **None** implies that there is no direct affect to the chiller, sub components or functional operation.

Severity: Defines the severity of the above effect. **Immediate** means immediate shutdown of the effected portion, **Normal** means normal or friendly shutdown of the effected portion, **Special Mode** means a special mode of operation (limp along) is invoked, but without shutdown, and **Warning** means an Informational Note or Warning is generated.

Persistence: Defines whether or not the diagnostic and its effects are to be manually reset (Latched), or can be either manually or automatically reset (Nonlatched).

Active Modes [Inactive Modes]: States the modes or periods of operation that the diagnostic is active in and, as necessary, those modes or periods that it is specifically not active in as an exception to the active modes. The inactive modes are enclosed in brackets, [ ]. Note that the modes used in this column are internal and not generally annunciated to any of the formal mode displays

Criteria: Quantitatively defines the criteria used in generating the diagnostic and, if nonlatching, the criteria for auto reset. If more explanation is necessary a hot link to the Functional Specification is used.

Reset Level: Defines the lowest level of manual diagnostic reset command which can clear the diagnostic. The manual diagnostic reset levels in order of priority are: **Local** and **Remote**. A diagnostic that has a reset level of Local, can only be reset by a local diagnostic reset command, but not by the lower priority remote Reset command whereas a diagnostic listed as Remote reset can be reset by either.

Help Text: Provides for a brief description of what kind of problems might cause this diagnostic to occur. Both control system component related problems as well as chiller application related problems are addressed (as can possibly be anticipated). These help messages will be updated with accumulated field experience with the chillers.

Main Processor Diagnostics

Diagnostic Name	Affects	Severity	Persistence	Active Modes [Inactive Modes]	Criteria	Reset Level
MP: Reset Has Occurred *MP: Reset Has Occurred* MP: Reset Has Occurred	Chiller	Warning	NonLatch	All	The main processor has successfully come out of a reset and built its application. A reset may have been due to a power up, installing new software or configuration. This diagnostic is immediately and automatically cleared and thus can only be seen in the historic diagnostic list.	NA
MP: Non-Volatile Block Test Error *MP: Non-Volatile Block Test Error* MP: NV Block Test Error	Platform	Warning	Latch	All	MP has determined there was an error with a block in the Non-Volatile memory. Check settings.	
MP: Non-Volatile Memory Reformatted *MP: Non-Volatile Memory Reformatted* MP: NV Memory Reformatted	Platform	Warning	Latch	All	MP has determined there was an error in a sector of the Non-Volatile memory and it was reformatted. Check settings.	Remote
MP: Could not Store Starts and Hours *MP: Could not Store Starts and Hours* MP: Starts and Hours Failure	Platform	Warning	Latch	All	MP has determined there was an error with the previous power down store. Starts and Hours may have been lost for the last 24 hours.	Remote
Check Clock *Check Clock* Check Clock	Platform	Warning	Latch	All	The real time clock had detected loss of its oscillator at some time in the past. Check / replace battery? This diagnostic can be effectively cleared only by writing a new value to the chiller's time clock using the TechView or DynaView's "set chiller time" functions.	Remote
Phase Protection Fault *Phase Protection Fault* Phase Protection Fault	Chiller	Immediate	Latch	All	Phase protection module recognized a phase loss or phase reversal of the line power.	Local
Low Pressure Cutout *Low Pressure Cutout* Low Pressure Cutout	Circuit	Immediate	Latch	All	The suction refrigerant pressure fell below the low pressure cutout trip point. See the Very Low Suction Pressure below for more details.	Local
Very Low Suction Pressure – Circuit 1 *Very Low Suction Pressure – Circuit 1* Very Low Suct Press – Ckt 1	Chiller	Immediate	Latch	All [circuit in manual lockout]	The circuit's suction pressure dropped below (Low Pressure Cutout Setpoint (kPa absolute) * 0.5) regardless of whether or not compressors are running on that circuit. This diagnostic was created to prevent compressor failures due to cross-binding by forcing an entire chiller shutdown. If a given circuit is locked out, the suction pressure transducer associated with it will be excluded from causing this diagnostic.	Local

Very Low Suction Pressure – Circuit 2 *Very Low Suction Pressure – Circuit 2* Very Low Suct Press – Ckt 2	Chiller	Immediate	Latch	All [circuit in manual lockout]	The circuit's suction pressure dropped below (Low Pressure Cutout Setpoint (kPa absolute) * 0.5) regardless of whether or not compressors are running on that circuit. This diagnostic was created to prevent compressor failures due to crossbinding by forcing an entire chiller shutdown. If a given circuit is locked out, the suction pressure transducer associated with it will be excluded from causing this diagnostic.	Local
High Discharge Temperature *High Discharge Temperature* High Discharge Temperature	Circuit	Immediate	NonLatch	Ckt Energized [Ckt Not Energized]	The discharge temperature exceeded the limits for the compressor.	Local
High Discharge Temperature Lockout *High Discharge Temperature Lockout* High Discharge Temp Lockout	Circuit	Immediate	Latch	All	High discharge temperature diagnostics occurred over 210 minutes.	
Compressor Fault *Compressor Fault* Compressor Fault	Cprsr	Immediate	NonLatch	All	The compressor fault switch input is open.	Local
Compressor Fault Lockout *Compressor Fault Lockout* Compressor Fault Lockout	Cprsr	Immediate	Latch	All	The compressor fault switch input remained open for more than 35 minutes. Five compressor fault diagnostics have occurred within the last 210 minutes.	Local
BAS Failed to Establish Communication *BAS Failed to Establish Communication* BAS Failed to Establish Comm	Chiller	Special	NonLatch	At power-up	The BAS was setup as "installed" and the BAS did not communicate with the MP within 15 minutes after power-up.	Remote
BAS Communication Lost *BAS Communication Lost* BAS Communication Lost	Chiller	Special	NonLatch	All	The BAS was setup as "installed" at the MP and the LCI-C LLID lost communications with the BAS for 15 continuous minutes after it had been established.	Remote
LCI-C Software Mismatch: Use BAS Tool *LCI-C Software Mismatch: Use BAS Tool* LCI-C Software: Use BAS Tool	Chiller	Warning	NonLatch	All	LCI-C Neuron software and LCI-C IPC3 software do not match. Load new LCI-C Neuron software using LonTalk service tool.	Remote
External Chilled/Hot Water Setpoint *External Chilled/Hot Water Setpoint* Ext Chilled/Hot Water Setpt	Chiller	Warning	NonLatch	All	a. Function Not "Enabled": no diagnostics. B. "Enabled ": Out-Of-Range Low or Hi or bad LLID, set diagnostic, default CWS/HWS to next level of priority (e.g. Front Panel SetPoint). This Warning diagnostic will automatically reset if the input returns to the normal range.	Remote

External Demand Limit Setpoint *External Demand Limit Setpoint* External Demand Limit Setpt	Chiller	Warning	NonLatch	All	a. Function Not "Enabled": no diagnostics. B. "Enabled ": Out-Of-Range Low or Hi or bad LLID, set diagnostic, default DLS to next level of priority (e.g. Front Panel SetPoint). This Warning diagnostic will automatically reset if the input returns to the normal range.	Remote
Circuit Pumpdown Terminated *Circuit Pumpdown Terminated* Circuit Pumpdown Terminated	Circuit	Warning	Latching	Operational/ Service Pumpdown [All Except Operational and Service Pumpdown]	The procedure did not terminate normally by reaching the termination pressure within the allotted time. See "Compressor Operational Pump Down," p. 136 or "Compressor Service Pump Down Procedure," p. 136.	Remote
Chilled Water Flow (Entering Water Temp) *Chilled Water Flow (Entering Water Temp)* Chilled Wtr Flow (Ent Temp)	Chiller	Immediate	Latching	Any Ckt(s) Energized [No Ckt(s) Energized]	The entering evaporator water temp fell below the leaving evaporator water temperature by more than 3°F for 100°F-sec while at least one compressor was running.	Remote
Inverted Water Temp (Heating) *Inverted Water Temp (Heating)* Inverted Wtr Temp (Heating)	Chiller	Immediate	Latching	Unit energized and all ckts' reversing valves in heating direction [Unit de-energized or any ckt's reversing valve in cooling direction]	The leaving evaporator water temp fell below the entering evaporator water temperature by more than 3°F for 100°F-sec. There is a 60 second ignore time after the condition to enable the diagnostic is met. During the ignore time, the temperature error is not integrated.	Remote
Low Evap Leaving Water Temp: Unit Off *Low Evap Leaving Water Temp: Unit Off* Low Evap Leav Wtr Temp: Off	Chiller or Circuit	Warning and Special Action	NonLatch	Unit in Stop Mode, or in Auto Mode and No Ckt(s) Energized [Any Ckt Energized]	a. The leaving chilled water temperature fell below the leaving water temp cutout setting for 30 degree F seconds while the Chiller is in the Stop mode, or in Auto mode with no compressors running. Energize Evap Water pump Relay until diagnostic auto resets, then return to normal evap pump control. Automatic reset occurs when the temp rises 2°F above the cutout setting for 30 minutes. When this diagnostic is active AND Leaving Water Temperature sensor diagnostic (loss of comm or out of range) the Evap Water pump relay shall be de-energized. b. If evaporator protection temperature sensors are installed, the effect is on the appropriate circuit. Else, the effect is on the chiller.	Remote

Low Evap Leaving Water Temp: Unit On *Low Evap Leaving Water Temp: Unit On* Low Evap Leav Wtr Temp: On	Chiller or Circuit	Immediate and Special Action	NonLatch	Any Ckt[s] Energized [No Ckt(s) Energized]	The chilled water temp. fell below the cutout setpoint for 30 degree F Seconds while a compressor was running. Automatic reset occurs when the temperature rises 2 °F above the cutout setting for 2 minutes. This diagnostic shall not de-energize the Evaporator Water Pump Output. If this diagnostic is active the Low Evap Leaving Water Temp: Unit Off diagnostic shall be suppressed. If evaporator protection temperature sensors are installed, the effect is on the appropriate circuit. Else, the effect is on the chiller.	Remote
Low Refrigerant Temperature *Low Refrigerant Temperature* Low Refrigerant Temperature	Circuit	Immediate	Latch	Circuit Energized [Service Pumpdown, Operational Pumpdown]	The suction saturated refrigerant temperature dropped below the Low Refrigerant Temperature Cutout Setpoint for 16.67°C-seconds (30°F-seconds). See "Low Refrigerant Temp Cutout:," p. 88 for min/max information or "Capacity Limited by Low Evap Rfgt Temp," p. 129 for limit conditions.	Local
High Evaporator Water Temperature *High Evaporator Water Temperature* High Evap Water Temperature	Chiller	Info and Special Action	NonLatch	Only effective if either 1) Evaporator Water Flow Overdue, 2) Evaporator Water Flow Lost, 3) Low Evap Water Temp: Unit Off, diagnostic is active.	The leaving water temperature exceeded the high evap water temp setting (TV service menu settable – default 55.0°C (131°F)) for 15 continuous seconds. The evaporator water pump relay will be de-energized to stop the pump, but only if it is running due to one of the diagnostics listed on the left. The diagnostic will auto reset and the pump will return to normal control when the temperature falls 2.778°C (5°F) below the trip setting. The primary purpose is to stop the evaporator water pump and its associated pump heat from causing excessive water-side temperatures and water-side pressures when the unit is not running but the evap pump is on due to either Evaporator Water Flow Overdue, Evaporator Water Flow Lost, or Low Evap Water Temp – Unit Off diagnostics. This diagnostic will not auto clear solely due to the clearing of the enabling diagnostic. *at unit installation, especially reversible units, high evap water temp setting will need to be written.	Remote

High Suction Refrigerant Pressure *High Suction Refrigerant Pressure* High Suction Rfgt Press	Chiller	Immediate	NonLatch	All	Any circuit's suction pressure has risen above 95% of the high pressure cutout setting. The evaporator water pump relay will be de-energized to stop the pump regardless of why the pump is running. The diagnostic will auto reset and the pump will return to normal control when all circuits' suction pressures fall below 85% of the high pressure cutout setting. The primary purpose is to stop the evaporator water pump and its associated pump heat from causing refrigerant side pressures close to the relief valve setting when the chiller is not running, such as could occur with Evaporator Water Flow Overdue, Evaporator Water Flow Lost, or Low Evap Water Temp – Unit Off diagnostics. This condition is unlikely unless a discharge isolation valve is installed and closed.	Remote
High Pressure Cutout *High Pressure Cutout* High Pressure Cutout	Circuit	Immediate	Latch	All	The high pressure cutout switch recognized a high pressure. See High Suction Refrigerant Pressure above for more details.	Local
High Discharge Refrigerant Pressure *High Discharge Refrigerant Pressure* High Discharge Rfgt Press	Circuit	Immediate	Latch	All	Discharge pressure exceeded the high pressure cutout setpoint + 100 kPa. Likely cause: failed or incorrectly set high pressure cutout switch. Prevents release of refrigerant through relief valve.	Local
Emergency Stop *Emergency Stop* Emergency Stop	Chiller	Immediate	Latch	All	Emergency Stop input is open.	Local
Starts/Hours Modified *Starts/Hours Modified* Starts/Hours Modified	Cprsr	Warning	NonLatch	All	A counter for compressor starts or hours has been modified by TechView. This diagnostic is immediately and automatically cleared and thus can only be seen in the historic diagnostic list.	NA
Evaporator Pump Starts/Hours Modified *Evaporator Pump Starts/Hours Modified* Evap Pmp Starts/Hrs Modified	Chiller	Warning	NonLatch	All	A counter for evaporator pump starts or hours has been modified by TechView. This diagnostic is immediately and automatically cleared and thus can only be seen in the historic diagnostic list.	NA
Evaporator Water Flow Lost *Evaporator Water Flow Lost* Evap Water Flow Lost	Chiller	Immediate and Special Action	NonLatch	All	After the pump request was activated, water flow was established and then lost. Special action is to keep the evap pump request active in a diagnostic override mode. See "Chilled Water Pump Control," p. 59 for more details.	Remote

Evaporator Water Flow Overdue *Evaporator Water Flow Overdue* Evap Water Flow Overdue	Chiller	Immediate and Special Action	NonLatch	All	After the pump request was activated, the evaporator water flow overdue wait time elapsed before water flow was established. Special action is to keep the evap pump request active in a diagnostic override mode. See "Chilled Water Pump Control," p. 59 for more details.	Remote
Evaporator Water Flow Lost – Pump 1 *Evaporator Water Flow Lost – Pump 1* Evap Water Flow Lost	Chiller	Warning and Special Action	NonLatch	All	For dual evaporator pump configurations only. Evaporator Water Flow Lost diagnostic occurred while Pump 1 was the selected pump. See "Chilled Water Pump Control - Field Supplied Dual Pumps," p. 60 for more details.	Remote
Evaporator Water Flow Lost – Pump 2 *Evaporator Water Flow Lost – Pump 2* Evap Water Flow Lost	Chiller	Warning and Special Action	NonLatch	All	For dual evaporator pump configurations only. Evaporator Water Flow Lost diagnostic occurred while Pump 2 was the selected pump. See "Chilled Water Pump Control - Field Supplied Dual Pumps," p. 60 for more details.	Remote
Evaporator Water Flow Overdue – Pump 1 *Evaporator Water Flow Overdue – Pump 1* Evap Water Flow Overdue	Chiller	Warning and Special Action	NonLatch	All	For dual evaporator pump configurations only. Evaporator Water Flow Overdue diagnostic occurred while Pump 1 was the selected pump. See "Chilled Water Pump Control - Field Supplied Dual Pumps," p. 60 for more details.	Remote
Evaporator Water Flow Overdue – Pump 2 *Evaporator Water Flow Overdue – Pump 2* Evap Water Flow Overdue	Chiller	Warning and Special Action	NonLatch	All	For dual evaporator pump configurations only. Evaporator Water Flow Overdue diagnostic occurred while Pump 2 was the selected pump.See "Chilled Water Pump Control - Field Supplied Dual Pumps," p. 60 for more details.	Remote
Fault Detected: Evaporator Water Pump 1 *Fault Detected: Evaporator Water Pump 1* Fault: Evap Water Pump	Chiller	Normal or Warning and Special Action	NonLatch	All	For systems with no evaporator pump or a single evaporator pump, a normal shutdown shall be performed. For multiple pump systems, detection of a pump fault will generally cause pump control to switch to the redundant pump. See "Chilled Water Pump Control - Field Supplied Dual Pumps," p. 60 for more details.	Remote
Fault Detected: Evaporator Water Pump 2 *Fault Detected: Evaporator Water Pump 2* Fault: Evap Water Pump	Chiller	Normal or Warning and Special Action	NonLatch	All	For systems with no evaporator pump or a single evaporator pump, a normal shutdown shall be performed. For multiple pump systems, detection of a pump fault will generally cause pump control to switch to the redundant pump. See "Chilled Water Pump Control - Field Supplied Dual Pumps," p. 60 for more details.	Remote

Fan Fault *Fan Fault* Fan Fault	Circuit	Warning	Latch	All	The fan deck is indicating a fault.	Local
Fan Inverter Fault *Fan Inverter Fault* Fan Inverter Fault	Circuit	Warning	NonLatch	All	The fan inverter fault input is ignored for the first 5 seconds of start up to allow variable speed drives to power up.	Local
Low Suction Superheat *Low Suction Superheat* Low Suction Superheat	Circuit	Immediate	Latch	Ckt Energized [Ckt Not Energized]	Measured suction superheat stays below 2.22 °C for one continuous minute, with a 1 minute ignore time fro m the start of the circuit. Suction Superheat = suction temp – sat. suction temp.	Local
High Compressor Pressure Differential *High Compressor Pressure Differential* High Cprsr Press Diff	Circuit	Immediate	Latch	Ckt Energized [Ckt Not Energized]	Compressor involute pressure differential (discharge pressure [absolute] – volume ratio * suction pressure [absolute]) exceeds 2550 kPa differential, or exceeds 1862 kPa differential for 30 continuous minutes. Nominal volume ratio for R410A compressors is 2.9.	Local
Low Differential Refrigerant Pressure *Low Differential Refrigerant Pressure* Low Differential Rfgt Press	Circuit	Normal	Latch	Ckt Energized [Ckt Not Energized]	The system differential pressure for the respective circuit was below 90 psid for more than 4000 psid-sec, with a 2.5 minute ignore time from the start of the circuit.	Local
Low Discharge Saturated Temperature *Low Discharge Saturated Temperature* Low Discharge Sat Temp	Circuit	Normal	Latch	Ckt Energized [Ckt Not Energized]	The discharge saturated temperature for the respective circuit was below 20 °C for more than 3750 °C-sec, with a 10 minute ignore time from the start of the circuit. Integration starts after the ignore time is completed.	Local
Software Error 1001: Call Trane Service *Software Error 1001: Call Trane Service* Software Error 1001	All functions	Immediate	Latch	All	A software monitor has detected a condition in which there was a continuous 1 minute period of compressor operation, with no Evaporator water flow. The presence of this software error message suggests an internal software problem has been detected. The events that led up to this failure, if known, should be recorded and transmitted to Trane Controls Engineering.	Local

Software Error 1002: Call Trane Service *Software Error 1002: Call Trane Service* Software Error 1002	All functions	Immediate	Latch	All	A software monitor has detected a condition in which there was a continuous 1 minute period of compressor operation, with a misaligned state machine. Reported if state chart misalignment occurred inferred form the Capacity Control, Circuit, or Compressor State Machines being in *Stopped state* or *Inactive state* while a compressor was operating and this condition existed for at least 1 minute. The presence of this software error message suggests an internal software problem has been detected. The events that led up to this failure, if known, should be recorded and transmitted to Trane Controls Engineering.	Local
Software Error 1003: Call Trane Service *Software Error 1003: Call Trane Service* Software Error 1003	All functions	Immediate	Latch	All	A software monitor has detected a condition in which there was a continuous 1 minute period of compressor operation, with a misaligned state machine. Reported if state chart misalignment occurred inferred from the Capacity Control, Circuit, or Compressor State Machines remaining in the *Stopping state* for more than 4 minutes with operating compressors. The presence of this software error message suggests an internal software problem has been detected. The events that led up to this failure, if known, should be recorded and transmitted to Trane Controls Engineering.	Local

Sensor Failure Diagnostics

Note: 1. The following sensor failure diagnostics will not occur unless that input or output is required to be present by the particular configuration and installed options for the unit. 2. Sensor diagnostics are named by the Functional Name of the input or output that is no longer sending a valid value to the Main Processor, indicating a sensor failure. Some LLIDs may have more than one functional output associated with it. Refer to the unit's wiring diagrams to relate the occurrence of such sensor failure diagnostics back to the physical LLID boards that they have been assigned to (bound).

Diagnostic Name	Affects	Severity	Persistence	Active Modes [Inactive Modes]	Criteria	Reset Level
Evaporator Entering Water Temp Sensor *Evaporator Entering Water Temp Sensor* Evap Ent Water Temp Sensor	Chiller	Normal	Latch	All	Bad Sensor or LLID.	Remote
Evaporator Leaving Water Temp Sensor *Evaporator Leaving Water Temp Sensor* Evap Leav Water Temp Sensor r	Chiller	Normal	Latch	All	Bad Sensor or LLID	Remote
Outdoor Air Temp Sensor *Outdoor Air Temp Sensor* Outdoor Air Temp Sensor	Chiller	Normal	Latch	All	Bad Sensor or LLID.	Remote
Discharge Pressure Transducer *Discharge Pressure Transducer* Discharge Pressure Xdcr	Circuit	Immediat e	Latch	All	Bad Sensor or LLID	Remote
Suction Pressure Transducer *Suction Pressure Transducer* Suction Pressure Xdcr	Circuit	Immediat e	Latch	All	Bad Sensor or LLID	Remote
Suction Temperature Sensor *Suction Temperature Sensor* Suction Temperature Sensor	Circuit	Immediat e	Latch	All	Bad Sensor or LLID	Remote
Discharge Temperature Sensor *Discharge Temperature Sensor* Discharge Temperature Sensor	Circuit	Immediat e	Latch	All	Bad Sensor or LLID	Remote
Heat Recovery Entering Water Temp Sensor *Heat Recovery Entering Water Temp Sensor* HR Entering Wtr Temp Sensor	Chiller	Warning	Latch	All	Bad Sensor or LLID	Remote
Heat Recovery Leaving Water Temp Sensor *Heat Recovery Leaving Water Temp Sensor* HR Leaving Wtr Temp Sensor	Chiller	Warning	Latch	All	Bad Sensor or LLID	Remote

Communication Diagnostics

Note: 1. The following communication loss diagnostics will not occur unless that input or output is required to be present by the particular configuration and installed options for the chiller. 2. Communication diagnostics (with the exception of "Excessive Loss of Comm" are named by the Functional Name of the input or output that is no longer being heard from by the Main Processor. Many LLIDs, such as the Quad Relay LLID, have more than one functional output associated with it. A comm loss with such a multiple function board, will generate multiple diagnostics. Refer to the Chiller's wiring diagrams to relate the occurrence of multiple communication diagnostics back to the physical llid boards that they have been assigned to (bound).

Diagnostic Name	Affects	Severity	Persistence	Active Modes [Inactive Modes]	Criteria	Reset Level
Excessive Loss of Comm *Excessive Loss of Comm* Excessive Loss of Comm	Chiller	Immediate	Latch	All	Loss of comm with 10 or more of the LLIDs configured for the system has been detected. This diagnostic will suppress the callout of all subsequent comm loss diagnostics. Check power supply(s) and power disconnects – troubleshoot LLID bus using TechView.	Remote
Comm Loss: External Auto/Stop *Comm Loss: External Auto/Stop* Comm: External Auto/Stop	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Emergency Stop *Comm Loss: Emergency Stop* Comm: Emergency Stop	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: External Ice Building Control Input *Comm Loss: Ext Ice Building Ctrl Input* Comm: Ext Ice Building Ctrl	Chiller	Warning	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period. Chiller shall revert to normal (non-ice building) mode regardless of last state.	Remote
Comm Loss: Outdoor Air Temperature *Comm Loss: Outdoor Air Temperature* Comm: Outdoor Air Temp	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Evap Leaving Water Temp *Comm Loss: Evap Leaving Water Temp* Comm: Evap Leav Water Temp	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Evap Entering Water Temp *Comm Loss: Evap Entering Water Temp* Comm: Evap Ent Water Temp	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote

Comm Loss: Discharge Pressure Transducer *Comm Loss: Discharge Pressure Transducer* Comm: Discharge Press Xdcr	Circuit	Immediate	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Suction Pressure Transducer *Comm Loss: Suction Pressure Transducer* Comm: Suction Pressure Xdcr	Circuit	Immediate	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Ext Chilled/Hot Wtr Setpoint *Comm Loss: Ext Chilled/Hot Wtr Setpoint* Comm: Ext Chil/Hot Wtr Setpt	Chiller	Warning and Special Action	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period. Chiller shall discontinue use of the External Chilled/Hot Water Setpoint source and revert to the next higher priority for setpoint arbitration	Remote
Comm Loss: Ext Demand Limit Setpoint *Comm Loss: Ext Demand Limit Setpoint* Comm: Ext Demand Limit Setpt	Chiller	Warning and Special Action	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period. Chiller shall discontinue use of the External Demand Limit Setpoint source and revert to the next higher priority for setpoint arbitration	Remote
Comm Loss: Auxiliary Setpoint Command *Comm Loss: Auxiliary Setpoint Command* Comm: Auxiliary Setpt Cmd	Chiller	Warning and Special Action	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period. Chiller shall discontinue use of the Auxiliary Setpoint and revert to the Chilled Water Setpoint based on setpoint arbitration	Remote
Comm Loss: High Pressure Cutout Switch *Comm Loss: High Pressure Cutout Switch* Comm: High Press Cutout Sw	Circuit	Immediate	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Evaporator Water Flow Switch *Comm Loss: Evaporator Water Flow Switch* Comm: Evap Water Flow Sw	Chiller	Immediate	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Local BAS Interface *Comm Loss: Local BAS Interface* Comm: Local BAS Interface	Chiller	Warning and Special Action	NonLatch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period. Use the last values sent from BAS.	Remote
Comm Loss: Compressor Fault Input *Comm Loss: Compressor Fault Input* Comm: Compressor Fault Input	Cprsr	Immediate	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Compressor Run Command *Comm Loss: Compressor Run Command* Comm: Cprsr Run Command	Cprsr	Immediate	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote

Comm Loss: Fan Control Relays *Comm Loss: Fan Control Relays* Comm: Fan Control Relays	Circuit	Immediate	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Fan Fault *Comm Loss: Fan Fault* Comm: Fan Fault	Circuit	Warning	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Fan Inverter Speed Command *Comm Loss: Fan Inverter Speed Command* Comm: Fan Inverter Speed Cmd	Circuit	Warning and Special Action	NonLatch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period. Revert to fixed-speed fan algorithm using remaining fans.	Remote
Comm Loss: Fan Inverter Fault *Comm Loss: Fan Inverter Fault* Comm: Fan Inverter Fault	Circuit	Warning and Special Action	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period. Revert to fixed-speed fan algorithm using remaining fans.	Remote
Comm Loss: Op Status Programmable Relays *Comm Loss: Op Status Programmable Relays* Comm: Op Status Relays	Chiller	Warning	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Anti-Freeze Heater Relay *Comm Loss: Anti-Freeze Heater Relay* Comm: Anti-Freeze Heater Rly	Chiller	Warning and Special Action	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Evaporator Water Pump 1 Relay *Comm Loss: Evaporator Water Pump 1 Relay* Comm: Evap Water Pump Relay	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Evaporator Water Pump 2 Relay *Comm Loss: Evaporator Water Pump 2 Relay* Comm: Evap Water Pump Relay	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Evaporator Pump 1 Fault Input *Comm Loss: Evaporator Pump 1 Fault Input* Comm: Evap Pump Fault Input	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Evaporator Pump 2 Fault Input *Comm Loss: Evaporator Pump 2 Fault Input* Comm: Evap Pump Fault Input	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Evap Pump Inverter 1 Run Command *Comm Loss: Evap Pump Inverter 1 Run Cmd* Comm: Evap Pmp Inv 1 Run Cmd	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote

Comm Loss: Evap Pump Inverter 1 Fault Input *Comm Loss: Evap Pump Inv 1 Fault Input* Comm: Evap Pmp Inv 1 Flt Inp	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Evap Pump Inverter 1 Frequency Feedback *Comm Loss: Evap Pump Inv 1 Freq Feedback* Comm: Evap Pmp Inv 1 Freq	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Suction Temperature *Comm Loss: Suction Temperature* Comm: Suction Temperature	Circuit	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Heat/Cool Switch *Comm Loss: Heat/Cool Switch* Comm: Heat/Cool Switch	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Electronic Expansion Valve *Comm Loss: Electronic Expansion Valve* Comm: EXV	Circuit	Immediate	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Cooling EXV *Comm Loss: Cooling EXV* Comm: Cooling EXV	Circuit	Immediate	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Heating EXV *Comm Loss: Heating EXV* Comm: Heating EXV	Circuit	Immediate	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: External Night Noise Setback Input *Comm Loss: Ext Night Noise Setback Input* Comm: Ext Night Noise Inp	Chiller	Warning and Special Action	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period. External input is excluded from arbitration logic per standard arbitration rules.	Remote
Comm Loss: Night Noise Setback Relay *Comm Loss: Night Noise Setback Relay* Comm: Night Noise Setbk Rly	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Phase Protection Fault Input *Comm Loss: Phase Protection Fault Input* Comm: Phase Protect Flt Inp	Chiller	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Discharge Temperature Sensor *Comm Loss: Discharge Temperature Sensor* Comm: Discharge Temp Sensor	Circuit	Immediate	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Subcooler Shutoff Valve Relay *Comm Loss: Subcooler Shutoff Valve Relay* Comm: Subcooler Shut Vlv Rly	Circuit	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote

Comm Loss: Heat Recovery Entering Water Temperature Sensor *Comm Loss: HR Entering Water Temperature* Comm: HR Entering Water Temp	Chiller	Warning	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Heat Recovery Leaving Water Temperature Sensor *Comm Loss: HR Leaving Water Temperature* Comm: HR Leaving Water Temp	Chiller	Warning	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote
Comm Loss: Reversing Valve *Comm Loss: Reversing Valve* Comm: Reversing Valve	Circuit	Normal	Latch	All	Continual loss of communication between the MP and the Functional ID has occurred for a 35-40 second period.	Remote

Main Processor- Boot Messages and Diagnostics

DynaView Display Message	Description Troubleshooting
Boot Software Part Numbers: LS Flash --> 6200-0318-XX MS Flash --> 6200-0319-XX	The "boot code" is the portion of the code that is resident in all MPs regardless of what application code (if any) is loaded. Its main function is to run power up tests and provide a means for downloading application code via the MP's serial connection. The Part numbers for the code are displayed in the lower left hand corner of the DynaView during the early portion of the power up sequence and during special programming and converter modes. See below. For the EasyView, the extension of the boot code part number is displayed for approximately 3 immediately following power up. // This is normal, but you should provide this information when contacting Technical Service about power up problems.
Err2: RAM Pattern 1 Failure	There were RAM errors detected in RAM Test Pattern #1. // Recycle power, if the error persists, replace MP.
Err2: RAM Pattern 2 Failure	There were RAM errors detected in RAM Test Pattern #2. //Recycle power, if the error persists, replace MP.
Err2: RAM Addr Test #1 Failure	There were RAM errors detected in RAM Address Test #1. // Recycle power, if error persists, replace MP.
Err2: RAM Addr Test #2 Failure	There were RAM errors detected in RAM Address Test #2. //Recycle power, if the error persists, replace MP.
No Application Present Please Load Application...	No Main Processor Application is present – There are no RAM Test Errors. // Connect a TechView Service Tool to the MP's serial port, provide chiller model number (configuration information) and download the configuration if prompted by TechView. Then proceed to download the most recent RTAC application or specific version as recommended by Technical Service.
MP: Invalid Configuration	MP has an invalid configuration based on the current software installed
MP Application Memory CRC Error	App software inside the MP failed its own checksum test. Possible causes: application software in the MP is not complete – software download to the MP was not completed successfully - or MP hardware problem. Note: User should attempt to reprogram the MP if this diagnostic occurs.
App Present. Running Selftest.... Selftest Passed	An application has been detected in the Main Processor's nonvolatile memory and the boot code is proceeding to run a check on its entirety. 8 seconds later, the boot code had completed and passed the (CRC) test. // Temporary display of this screen is part of the normal power up sequence.
App Present. Running Selftest... Err3: CRC Failure	An application has been detected in Main Processor's nonvolatile memory and the boot code is proceeding to run a check on its entirety. A few seconds later, the boot code had completed but failed the (CRC) test. //Connect a TechView Service Tool to the MP's serial port, provide chiller model number (configuration information) and download the configuration if prompted by TechView. Then proceed to download the most recent RTAC application or specific version as recommended by Technical Service. Note that this error display may also occur during the programming process, if the MP never had a valid application any time prior to the download. If the problem persists, replace the MP.
A Valid Configuration is Present	A valid configuration is present in the MP's nonvolatile memory. The configuration is a set of variables and settings that define the physical makeup of this particular chiller. These include: number/airflow,/and type of fans, number/and size of compressors, special features, characteristics, and control options. // Temporary display of this screen is part of the normal power up sequence.

Err4: UnHandled Interrupt Restart Timer: [3 sec countdown timer]	An unhandled interrupt has occurred while running the application code. This event will normally cause a safe shutdown of the entire chiller. Once the countdown timer reaches 0, the processor will reset, clear diagnostics, and attempt to restart the application and allow a normal restart of chiller as appropriate. // This condition might occur due to a severe electro-magnetic transient such as can be caused by a near lightening strike. Such events should be rare or isolated and if no damage results to the CH.530 control system, the Chiller will experience a shutdown and restart. If this occurs more persistently it may be due to an MP hardware problem. Try replacing the MP. If replacement of the MP proves ineffective, the problem may be a result of extremely high radiated or conducted EMI. Contact Technical Service. If this screen occurs immediately after a software download, attempt to reload both the configuration and the application. Failing this, contact Technical Service.
Err5: Operating System Error Restart Timer: [3 sec countdown timer]	An Operating System error has occurred while running the application code. This event will normally cause a safe shutdown of the entire chiller. Once the countdown timer reaches 0, the processor will reset, clear diagnostics, and attempt to restart the application and allow a normal restart of chiller as appropriate. // See Err 4 above
Err6: Watch Dog Timer Error Restart Timer: [3 sec countdown timer]	A Watch Dog Timer Error has occurred while running the application code. This event will normally cause a safe shutdown of the entire chiller. Once the countdown timer reaches 0, the processor will reset, clear diagnostics, and attempt to restart the application allowing a normal restart of chiller as appropriate.
Err7: Unknown Error Restart Timer: [3 sec countdown timer]	An unknown Error has occurred while running the application code. This event will normally cause a safe shutdown of the entire chiller. Once the countdown timer reaches 0, the processor will reset, clear diagnostics, and attempt to restart the application allowing a normal restart of chiller as appropriate
Err8: Held in Boot by User Key Press [3 sec countdown timer]	A touch was detected during boot indicating the user wanted to stay in boot mode. This mode can be used to recover from a fatal software error in the application code. Cycle power on the MP to clear this error if it was unintentional.
Converter Mode	A command was received from the Service Tool (TechView) to stop the running application and run in the “converter mode”. In this mode the MP acts as a simple gateway and allows the TechView service computer to talk to all the LLIDS on the IPC3 bus.
Programming Mode	A command was received by the MP from the TechView Service Tool and the MP is in the process of first erasing and then writing the program code to its internal Flash (nonvolatile) Memory. Note that if the MP never had a prior application already in memory, the error code “Err3”will be displayed instead of this, during the programming download process.

Unit Wiring

This section provides field wiring diagrams, electrical schematics and connection diagrams for 20-120 ton CGAM units.

TRANE	2309–2075	SHEET 3 OF 20	REV C
THIS DRAWING IS PROPRIETARY AND SHALL NOT BE COPIED OR ITS CONTENTS DISCLOSED TO OUTSIDE PARTIES WITHOUT THE WRITTEN CONSENT OF TRANE DRAWN BY: A ROBERTS ©TRANE DATE: 30 NOV 2008	SCHEMATIC		
REPLACES:	CGAM / CXAM		
REVISION DATE: 19 MAR 2009	NOTES		
SIMILIAR TO:	SLANT FRAME NORTH AMERICA PRODUCTION		

GENERAL NOTES:

1. UNLESS OTHERWISE NOTED, ALL SWITCHES ARE SHOWN AT 25°C (77F), AT ATMOSPHERIC PRESSURE, AT 50% RELATIVE HUMIDITY, WITH ALL UTILITIES TURNED OFF, AND AFTER A NORMAL SHUTDOWN HAS OCCURRED.
2. DASHED LINES INDICATE RECOMMENDED FIELD WIRING BY OTHERS.
   DASHED LINE ENCLOSURES AND/OR DASHED DEVICE OUTLINES INDICATE COMPONENTS PROVIDED BY THE FIELD.
   PHANTOM LINE ENCLOSURES INDICATE ALTERNATE CIRCUITRY OR AVAILABLE SALES OPTIONS.
   SOLID LINE INDICATES WIRING BY TRANE.
3. NUMBERS ALONG THE RIGHT SIDE OF THE SCHEMATIC DESIGNATE THE LOCATION OF CONTACTS BY LINE NUMBER. AN UNDERLINED NUMBER INDICATES A NORMALLY CLOSED CONTACT.
4. ALL FIELD WIRING MUST BE IN ACCORDANCE WITH THE NATIONAL ELECTRIC CODE (NEC), STATE AND LOCAL REQUIREMENTS.
5. CLASS 1 FIELD WIRING INSULATION RATING IS REQUIRED TO BE EQUAL TO OR GREATER THAN THE EQUIPMENT SUPPLY VOLTAGE RATING. CLASS 2 FIELD WIRE INSULATION TO BE RATED AT 300V MINIMUM.

FLAG NOTES:

1 ALL UNIT POWER WIRING MUST BE COPPER CONDUCTORS ONLY, HAVE A MINIMUM INSULATION TEMPERATURE RATING OF 90°C AND BE SELECTED AT 75°C RATINGS.

2 TERMINAL BLOCK(1X1/1X2) IS PROVIDED AS STANDARD ON ALL UNITS PNCO=TERM. CIRCUIT BREAKER(1Q1/1Q3) PNCO=CB AVAILABLE AS OPTION. TERMINAL BLOCK IS REPLACED WITH CIRCUIT BREAKER WHEN THIS OPTION IS SELECTED.

5 ELECTRONIC PROTECTION MODULE USED FOR 15–30 TON COMPRESSORS ONLY.
FOR 10–13TON COMPRESSOR CONTROL CIRCUIT, TERMINALS (16,19), (16,20) ARE JUMPED BY W4 AND W5. TERMINALS (15,18), (15,17) ARE JUMPED BY W6, AND W7 IN V CONFIGURATION. (NTON= 020, 026, 040 OR 052)

6 SINGLE SPEED FAN 1 PRESENT WHEN:
STANDARD AMBIENT UNITS WITH 4 OR MORE FANS PER CIRCUIT, (NTON=100, 110, 120, OR 130) AND (UAPP=STDC OR HATC)

7 VSD AND ASSOCIATED CONTROL CIRCUITS ON FAN 1 PRESENT WHEN:
LOW AMBIENT, AND WIDE AMBIENT UNITS.
UNITS WITH PHR FAN CONTROL OPTION.

8 TWO SPEED FAN 1 PRESENT WHEN:
STANDARD AMBIENT UNIT WITH TWO OR THREE FANS PER CIRCUIT, (NTON= 020, 026, 030, 035, 040, 052, 060, 070, 080, OR 090) AND (UAPP=STDC OR HATC)

9 REFER TO FAN CHART FOR VALID FAN CONFIGURATIONS.

10 TRANSFORMER FOR 575V UNITS ONLY. (VOLT=575) AND (UAPP=CATC OR WIDC)

14 OPTIONAL DUAL CUSTOMER SUPPLIED EVAP WATER PUMP(S). 6M2 WIRING PRESENT FOR DUAL PUMP CONFIGURATION ONLY. PUMP CONTROL CONFIGURATION SHOWS WIRING WITH CONTACTORS AND OVERLOAD RELAYS. PUMP(S) CAN ALSO BE POWERED BY CUSTOMER CONTROLLED VSD(S). PUMP STARTER FAULT SIGNAL(S) TO BE FIELD WIRED TO 1A12 (INSET "AX").

16 CUSTOMER SUPPLIED PUMP RUN SIGNAL TO BE FIELD WIRED TO 1A9.

17 WIRING FOR 200V/460V UNIT SHOWN. SEE INSET "B" FOR CONTROL POWER TRANSFORMER WIRING OF OTHER VOLTAGES.

18 CONTACT CLOSURE ENABLES ICE MAKING, WHEN ICE MAKING OPTION IS ORDERED. (EVLT=ICE)

21 CLASS 1 FIELD WIRED MODULE.

22 RELAY AT 120VAC: 7.2 AMPS RESISTIVE, 2.88 AMPS PILOT DUTY, 1/3 HP 7.2 FLA; AT 240VAC: 5 AMPS GENERAL PURPOSE.

23 FIELD ASSIGNED PROGRAMMABLE RELAYS. STAT=PRLY

14 OPTIONAL DUAL CUSTOMER SUPPLIED EVAP WATER PUMP(S). 6M2 WIRING PRESENT FOR DUAL PUMP CONFIGURATION ONLY. PUMP CONTROL CONFIGURATION SHOWS WIRING WITH CONTACTORS AND OVERLOAD RELAYS. PUMP(S) CAN ALSO BE POWERED BY CUSTOMER CONTROLLED VSD(S). PUMP STARTER FAULT SIGNAL(S) TO BE FIELD WIRED TO 1A12 (INSET "AX").

16 CUSTOMER SUPPLIED PUMP RUN SIGNAL TO BE FIELD WIRED TO 1A9.

17 WIRING FOR 200V/460V UNIT SHOWN. SEE INSET "B" FOR CONTROL POWER TRANSFORMER WIRING OF OTHER VOLTAGES.

18 CONTACT CLOSURE ENABLES ICE MAKING, WHEN ICE MAKING OPTION IS ORDERED. (EVLT=ICE)

21 CLASS 1 FIELD WIRED MODULE.

22 RELAY AT 120VAC: 7.2 AMPS RESISTIVE, 2.88 AMPS PILOT DUTY, 1/3 HP 7.2 FLA; AT 240VAC: 5 AMPS GENERAL PURPOSE.

23 FIELD ASSIGNED PROGRAMMABLE RELAYS. STAT=PRLY

24 CUSTOMER SUPPLIED POWER, 120V FOR NORTH AMERICA, 230V FOR ASIA AND PACIFIC RIM.

25 ONLY USED WHEN PUMP PACKAGE OPTION IS ORDERED. (PTYP=DSHP OR DHHP)

26 ONLY USED WHEN BUFFER TANK OPTION IS ORDERED. (BTNK=BTNK)

28 THE CONTACTS FOR AUTO STOP AND EMERGENCY STOP SWITCHES ARE JUMPERED AT THE FACTORY BY JUMPERS W2 & W3 TO ENABLE UNIT OPERATION. IF REMOTE CONTROL IS DESIRED, REMOVE THE JUMPERS AND CONNECT TO THE DESIRED CONTROL CIRCUIT.

30 PHASE PROTECTION RELAY USED ONLY FOR CIRCUIT(S) WITH 10 TON AND 13 TON COMPRESSORS (NTON = 20, 26, 40 or 52).

31 NOT PRESENT WHEN BOTH OF THE COMPRESSORS ARE LESS THAN 15 TON (NTON = 20, 26, 40 or 52).

32 GROUND SCREW IN MAIN CONTROL PANEL.

33 WHEN PUMP VSD IS PRESENT (PCON = VSD) PUMP CONTROL CONTACTORS (5K1/5K2) ARE INSIDE THE PUMP VSD AUXILIARY PANEL.

35 ONLY USED WHEN PARTIAL HEAT RECOVERY (CDHR = PRTF) OPTION IS ORDERED.

36 COMPRESSOR HEATER WIRE COLOR IS DETERMINED BY VOLTAGE IN CHART.

37 PRESENT ON "V" FRAME UNITS (NTON = 40, 52, 60 or 70).

38 PRESENT ON "W" FRAME UNITS (NTON = 80, 90, 100, 100, 120 or 130).

39 NOT PRESENT ON "W" FRAME UNITS, WITH 6 OR 8 FANS (NTON = 80, 90, 100, 110 or 120).

40 DISCHARGE REFIGERANT TEMPERATURE SENSOR PRESENT FOR ALL THE FOLLOWING OPTIONS: UNITS WITH ICEMAKING OPTION (EVLT = ICE), UNITS WITH LOW TEMPERATURE PROCESS COOLING (EVLT = PROC) , UNITS WITH PHR FAN CONTROL OPTION (CDHR = PRTF).

41 REFER TO FIELD WIRING DIAGRAM FOR SUGGESTED WIRING.

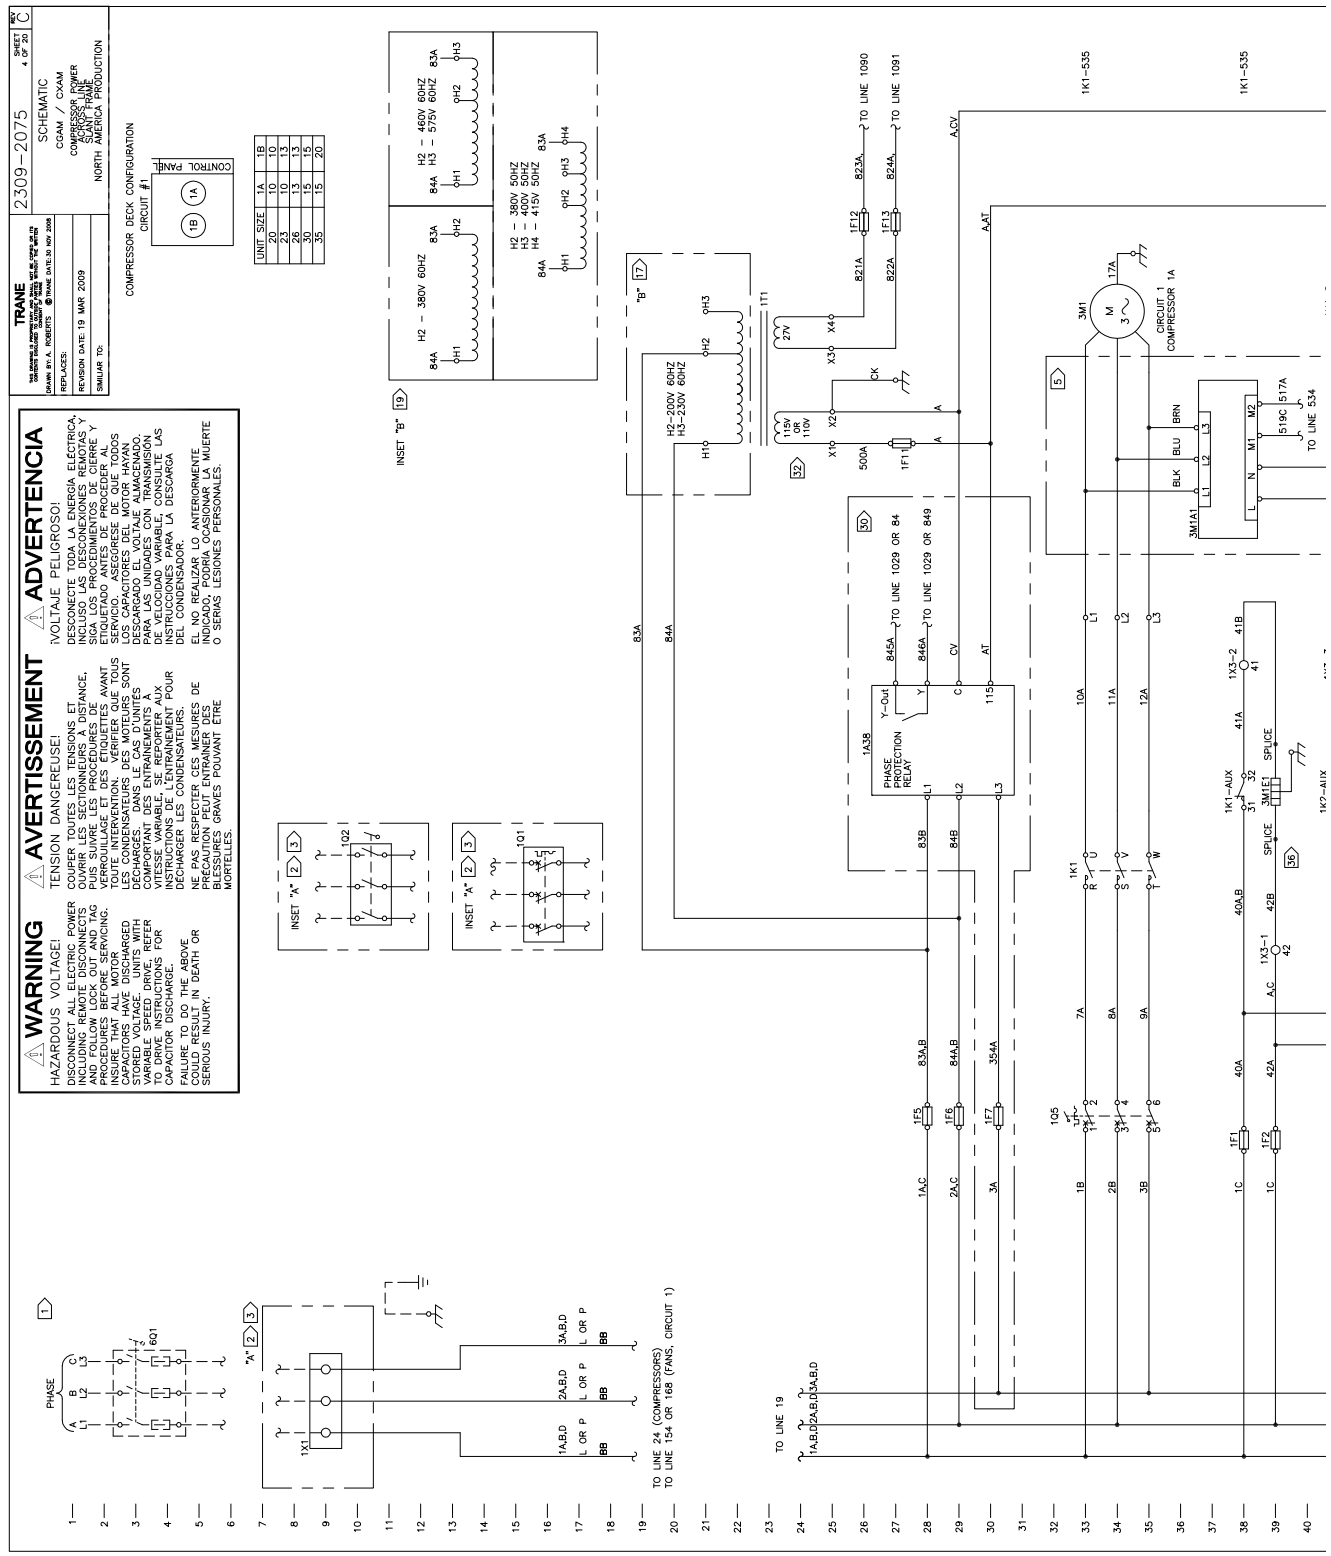
42 JUMPERS W10 AND W11 ARE INSTALLED BY THE FACTORY ON UNITS ORDERED WITH FIELD PROVIDED PUMPS (PTYP = NONE). JUMPERS W10 AND W11 ARE TO BE REMOVED WHEN PUMPS AND CONTROL ARE INSTALLED.

43 FUSES 1F38, 1F39, 1F40 PRESENT ON ALL SLANT (NTON = 20, 26, 30 or 35) AND V (NTON = 40, 52, 60 or 70) CONFIGURATIONS. PRESENT FOR W (NTON = 80, 90, 100, 110, 120 or 130)CONFIGURATION WHEN LINE VOLTAGE IS 575VAC (VOLT = 575).

47 VENTILATION FAN PRESENT WHEN LINE (VOLT = 200, 230VAC, 380 or 400).

50 1A41, BACNET INTERFACE MODULE USED WHEN (COMM = BCNT).

51 THERMOSTAT FOR VSD HEATER BLANKETS. USED WHEN FAN VSD IS PRESENT (UAPP=LATC OR WIDC)



WARNING
HAZARDOUS VOLTAGE!
DISCONNECT ALL ELECTRIC POWER INCLUDING REMOTE DISCONNECTS AND FOLLOW LOCK OUT AND TAG PROCEDURES BEFORE SERVICING. INSURE THAT ALL MOTOR CAPACITORS HAVE DISCHARGED STORED VOLTAGE. UNITS WITH VARIABLE SPEED DRIVE, REFER TO DRIVE INSTRUCTIONS FOR CAPACITOR DISCHARGE.
FAILURE TO DO THE ABOVE COULD RESULT IN DEATH OR SERIOUS INJURY.
AVERTISSEMENT
TENSION DANGEREUSE!
COUPER TOUTES LES TENSIONS ET, INCLUSO LES DESCONEXIONES REMOTAS Y PUIS SUIVRE LES PROCEDURES DE VERROUILLAGE ET DES ÉTIQUETTES AVANT D'INTERVENIR. S'ASSURER QUE TOUS LES CONDENSATEURS DES MOTEURS SONT DÉCHARGÉS. DANS LE CAS D'UNITÉS COMPORTANT DES ENTRAINEMENTS À VITESSE VARIABLE, SE REPORTER AUX INSTRUCTIONS DE L'ENTRAINEMENT POUR DÉCHARGER LES CONDENSATEURS.
NE PAS RESPECTER CES MESURES DE PRÉCAUTION PEUT ENTRAINER DES BLESSURES GRAVES POUVANT ÊTRE MORTELLES.
ADVERTENCIA
¡VOLTAJE PELIGROSO!
DESCONECTE TODA LA ENERGÍA ELECTRICA, SIGA LOS PROCEDIMIENTOS DE CIERRE Y ETIQUETADO ANTES DE PROCEDER AL SERVICIO. ASEGÚRESE DE QUE TODOS LOS CAPACITORES DEL MOTOR HAYAN DESCARGADO EL VOLTAJE ALMACENADO. PARA LAS UNIDADES CON TRANSMISIÓN DE FRECUENCIA VARIABLE, CONSULTE LAS INSTRUCCIONES PARA LA DESCARGA DEL CONDENSADOR.
EL NO REALIZAR LO ANTERIORMENTE INDICADO, PODRÍA OCASIONAR LA MUERTE O SERIAS LESIONES PERSONALES.

LAS TERMINALES DE LA UNIDAD NO ESTÁN DISEÑADAS PARA ACEPTAR OTROS TIPOS DE CONDUCTORES.
NO SEGUIR LAS INSTRUCCIONES ANTERIORES PUEDE PROVOCAR DAÑOS EN EL EQUIPO.

WARNING
HAZARDOUS VOLTAGE!
DISCONNECT ALL ELECTRIC POWER INCLUDING REMOTE DISCONNECTS AND FOLLOW LOCK OUT AND TAG PROCEDURES BEFORE SERVICING. INSURE THAT ALL MOTOR CAPACITORS HAVE DISCHARGED STORED VOLTAGE. UNITS WITH VARIABLE SPEED DRIVE, REFER TO DRIVE INSTRUCTIONS FOR CAPACITOR DISCHARGE.
FAILURE TO DO THE ABOVE COULD RESULT IN DEATH OR SERIOUS INJURY.
AVERTISSEMENT
TENSION DANGEREUSE!
COUPER TOUTES LES TENSIONS ET OUVRIR LES SECTIONNEURS À DISTANCE, PUIS SUIVRE LES PROCÉDURES DE VERROUILLAGE ET D'ÉTIQUETAGE AVANT TOUTE INTERVENTION. VÉRIFIER QUE TOUS LES CONDENSATEURS DES MOTEURS SONT DÉCHARGÉS. DANS LE CAS D'UNITÉS COMPORTANT DES ENTRAÎNEMENTS À VITESSE VARIABLE, SE REPORTER AUX INSTRUCTIONS DE L'ENTRAÎNEMENT POUR DÉCHARGER LES CONDENSATEURS.
NE PAS RESPECTER CES MESURES DE PRÉCAUTION PEUT ENTRAÎNER DES BLESSURES GRAVES POUVANT ÊTRE MORTELLES.
ADVERTENCIA
¡VOLTAJE PELIGROSO!
DESCONECTE TODA LA ENERGÍA ELÉCTRICA, INCLUSO LAS DESCONEXIONES REMOTAS Y SIGA LOS PROCEDIMIENTOS DE ETIQUETADO Y CIERRE ANTES DE DAR SERVICIO. ASEGÚRESE DE QUE TODOS LOS CAPACITORES DEL MOTOR HAYAN DESCARGADO EL VOLTAJE ALMACENADO. PARA LAS UNIDADES CON TRANSMISIÓN DE VELOCIDAD VARIABLE, CONSULTE LAS INSTRUCCIONES PARA LA DESCARGA DEL CONDENSADOR.
EL NO REALIZAR LO ANTERIORMENTE INDICADO, PODRÍA OCASIONAR LA MUERTE O SERIAS LESIONES PERSONALES.

40-70 Ton - “V Frame” - Notes

TRANE THIS DRAWING IS PROPRIETARY AND SHALL NOT BE COPIED OR ITS CONTENTS DISCLOSED TO OUTSIDE PARTIES WITHOUT THE WRITTEN CONSENT OF TRANE DRAWN BY: A ROBERTS ©TRANE DATE: 30 NOV 2008	2309–2075 SHEET 3 OF 20 REV C
REPLACES:	SCHEMATIC CGAM / CXAM NOTES V FRAME NORTH AMERICA PRODUCTION
REVISION DATE: 19 MAR 2009	
SIMILIAR TO:	

GENERAL NOTES:

1. UNLESS OTHERWISE NOTED, ALL SWITCHES ARE SHOWN AT 25°C (77F), AT ATMOSPHERIC PRESSURE, AT 50% RELATIVE HUMIDITY, WITH ALL UTILITIES TURNED OFF, AND AFTER A NORMAL SHUTDOWN HAS OCCURRED.
2. DASHED LINES INDICATE RECOMMENDED FIELD WIRING BY OTHERS. DASHED LINE ENCLOSURES AND/OR DASHED DEVICE OUTLINES INDICATE COMPONENTS PROVIDED BY THE FIELD. PHANTOM LINE ENCLOSURES INDICATE ALTERNATE CIRCUITRY OR AVAILABLE SALES OPTIONS. SOLID LINE INDICATES WIRING BY TRANE.
3. NUMBERS ALONG THE RIGHT SIDE OF THE SCHEMATIC DESIGNATE THE LOCATION OF CONTACTS BY LINE NUMBER. AN UNDERLINED NUMBER INDICATES A NORMALLY CLOSED CONTACT.
4. ALL FIELD WIRING MUST BE IN ACCORDANCE WITH THE NATIONAL ELECTRIC CODE (NEC), STATE AND LOCAL REQUIREMENTS.
5. CLASS 1 FIELD WIRING INSULATION RATING IS REQUIRED TO BE EQUAL TO OR GREATER THAN THE EQUIPMENT SUPPLY VOLTAGE RATING. CLASS 2 FIELD WIRE INSULATION TO BE RATED AT 300V MINIMUM.

FLAG NOTES:

1 ALL UNIT POWER WIRING MUST BE COPPER CONDUCTORS ONLY, HAVE A MINIMUM INSULATION TEMPERATURE RATING OF 90°C AND BE SELECTED AT 75°C RATINGS.

2 TERMINAL BLOCK(1X1/1X2) IS PROVIDED AS STANDARD ON ALL UNITS PNCO=TERM. CIRCUIT BREAKER(1Q1/1Q3) PNCO=CB AVAILABLE AS OPTION. TERMINAL BLOCK IS REPLACED WITH CIRCUIT BREAKER WHEN THIS OPTION IS SELECTED.

3 SINGLE SOURCE POWER IS PROVIDED AS STANDARD ON THESE PRODUCTS, DUAL SOURCE POWER IS OPTIONAL. FIELD CONNECTIONS FOR SINGLE SOURCE POWER ARE MADE TO 1X1, 1Q1, OR 1Q2. WHEN THE OPTIONAL DUAL SOURCE POWER IS SELECTED THE FIELD CONNECTIONS FOR CIRCUIT #2 ARE MADE TO 1X2, 1Q3, OR 1Q4.

5 ELECTRONIC PROTECTION MODULE USED FOR 15–30 TON COMPRESSORS ONLY. FOR 10–13TON COMPRESSOR CONTROL CIRCUIT, TERMINALS (16,19), (16,20) ARE JUMPED BY W4 AND W5. TERMINALS (15,18), (15,17) ARE JUMPED BY W6, AND W7 IN V CONFIGURATION. (NTON= 020, 026, 040 OR 052)

6 SINGLE SPEED FAN 1 PRESENT WHEN: STANDARD AMBIENT UNITS WITH 4 OR MORE FANS PER CIRCUIT, (NTON=100, 110, 120, OR 130) AND (UAPP=STDC OR HATC)

7 VSD AND ASSOCIATED CONTROL CIRCUITS ON FAN 1 PRESENT WHEN: LOW AMBIENT, AND WIDE AMBIENT UNITS. UNITS WITH PHR FAN CONTROL OPTION.

8 TWO SPEED FAN 1 PRESENT WHEN: STANDARD AMBIENT UNIT WITH TWO OR THREE FANS PER CIRCUIT, (NTON= 020, 026, 030, 035, 040, 052, 060, 070, 080, OR 090) AND (UAPP=STDC OR HATC)

9 REFER TO FAN CHART FOR VALID FAN CONFIGURATIONS.

10 TRANSFORMER FOR 575V UNITS ONLY. (VOLT=575) AND (UAPP=CATC OR WIDC)

14 OPTIONAL DUAL CUSTOMER SUPPLIED EVAP WATER PUMP(S). 6M2 WIRING PRESENT FOR DUAL PUMP CONFIGURATION ONLY. PUMP CONTROL CONFIGURATION SHOWS WIRING WITH CONTACTORS AND OVERLOAD RELAYS. PUMP(S) CAN ALSO BE POWERED BY CUSTOMER CONTROLLED VSD(S). PUMP STARTER FAULT SIGNAL(S) TO BE FIELD WIRED TO 1A12 (INSET "AX").

16 CUSTOMER SUPPLIED PUMP RUN SIGNAL TO BE FIELD WIRED TO 1A9.

17 WIRING FOR 200V/460V UNIT SHOWN. SEE INSET "B" FOR CONTROL POWER TRANSFORMER WIRING OF OTHER VOLTAGES.

18 CONTACT CLOSURE ENABLES ICE MAKING, WHEN ICE MAKING OPTION IS ORDERED. (EVLT=ICE)

21 CLASS 1 FIELD WIRED MODULE.

22 RELAY AT 120VAC: 7.2 AMPS RESISTIVE, 2.88 AMPS PILOT DUTY, 1/3 HP 7.2 FLA; AT 240VAC: 5 AMPS GENERAL PURPOSE.

23 FIELD ASSIGNED PROGRAMMABLE RELAYS. STAT=PRLY

14 OPTIONAL DUAL CUSTOMER SUPPLIED EVAP WATER PUMP(S). 6M2 WIRING PRESENT FOR DUAL PUMP CONFIGURATION ONLY. PUMP CONTROL CONFIGURATION SHOWS WIRING WITH CONTACTORS AND OVERLOAD RELAYS. PUMP(S) CAN ALSO BE POWERED BY CUSTOMER CONTROLLED VSD(S). PUMP STARTER FAULT SIGNAL(S) TO BE FIELD WIRED TO 1A12 (INSET "AX").

16 CUSTOMER SUPPLIED PUMP RUN SIGNAL TO BE FIELD WIRED TO 1A9.

17 WIRING FOR 200V/460V UNIT SHOWN. SEE INSET "B" FOR CONTROL POWER TRANSFORMER WIRING OF OTHER VOLTAGES.

18 CONTACT CLOSURE ENABLES ICE MAKING, WHEN ICE MAKING OPTION IS ORDERED. (EVLT=ICE)

21 CLASS 1 FIELD WIRED MODULE.

22 RELAY AT 120VAC: 7.2 AMPS RESISTIVE, 2.88 AMPS PILOT DUTY, 1/3 HP 7.2 FLA; AT 240VAC: 5 AMPS GENERAL PURPOSE.

23 FIELD ASSIGNED PROGRAMMABLE RELAYS. STAT=PRLY

24 CUSTOMER SUPPLIED POWER, 120V FOR NORTH AMERICA, 230V FOR ASIA AND PACIFIC RIM.

25 ONLY USED WHEN PUMP PACKAGE OPTION IS ORDERED. (PTYP=DSHP OR DHHP)

26 ONLY USED WHEN BUFFER TANK OPTION IS ORDERED. (BTNK=BTNK)

28 THE CONTACTS FOR AUTO STOP AND EMERGENCY STOP SWITCHES ARE JUMPERED AT THE FACTORY BY JUMPERS W2 & W3 TO ENABLE UNIT OPERATION. IF REMOTE CONTROL IS DESIRED, REMOVE THE JUMPERS AND CONNECT TO THE DESIRED CONTROL CIRCUIT.

30 PHASE PROTECTION RELAY USED ONLY FOR CIRCUIT(S) WITH 10 TON AND 13 TON COMPRESSORS (NTON = 20, 26, 40 or 52).

31 NOT PRESENT WHEN BOTH OF THE COMPRESSORS ARE LESS THAN 15 TON (NTON = 20, 26, 40 or 52).

32 GROUND SCREW IN MAIN CONTROL PANEL.

33 WHEN PUMP VSD IS PRESENT (PCON = VSD) PUMP CONTROL CONTACTORS (5K1/5K2) ARE INSIDE THE PUMP VSD AUXILIARY PANEL.

35 ONLY USED WHEN PARTIAL HEAT RECOVERY (CDHR = PRTF) OPTION IS ORDERED.

36 COMPRESSOR HEATER WIRE COLOR IS DETERMINED BY VOLTAGE IN CHART.

37 PRESENT ON "V" FRAME UNITS (NTON = 40, 52, 60 or 70).

38 PRESENT ON "W" FRAME UNITS (NTON = 80, 90, 100, 100, 120 or 130).

39 NOT PRESENT ON "W" FRAME UNITS, WITH 6 OR 8 FANS (NTON = 80, 90, 100, 110 or 120).

40 DISCHARGE REFIGERANT TEMPERATURE SENSOR PRESENT FOR ALL THE FOLLOWING OPTIONS: UNITS WITH ICEMAKING OPTION (EVLT = ICE), UNITS WITH LOW TEMPERATURE PROCESS COOLING (EVLT = PROC) , UNITS WITH PHR FAN CONTROL OPTION (CDHR = PRTF).

41 REFER TO FIELD WIRING DIAGRAM FOR SUGGESTED WIRING.

42 JUMPERS W10 AND W11 ARE INSTALLED BY THE FACTORY ON UNITS ORDERED WITH FIELD PROVIDED PUMPS (PTYP = NONE). JUMPERS W10 AND W11 ARE TO BE REMOVED WHEN PUMPS AND CONTROL ARE INSTALLED.

43 FUSES 1F38, 1F39, 1F40 PRESENT ON ALL SLANT (NTON = 20, 26, 30 or 35) AND V (NTON = 40, 52, 60 or 70) CONFIGURATIONS. PRESENT FOR W (NTON = 80, 90, 100, 110, 120 or 130)CONFIGURATION WHEN LINE VOLTAGE IS 575VAC (VOLT = 575).

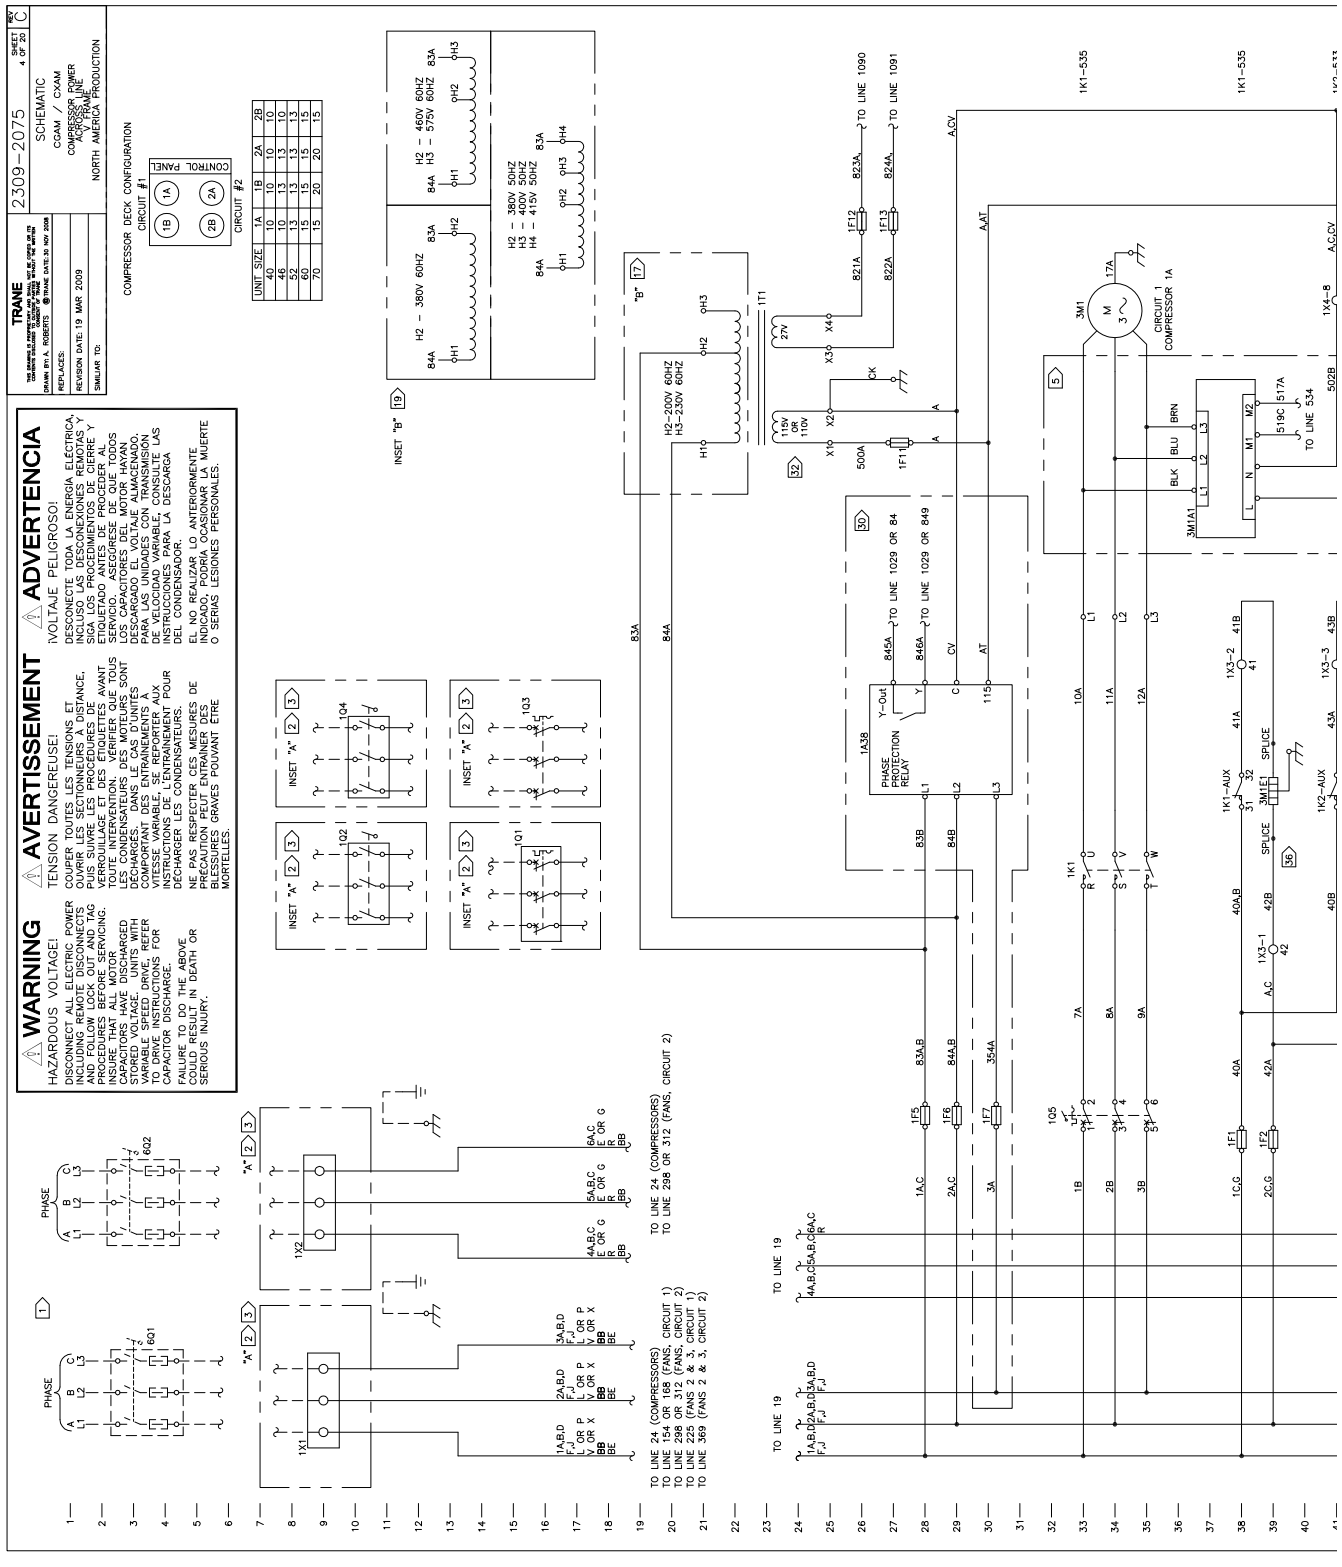
45 FUSES 1F44, 1F45, 1F46 PRESENT ON ALL V (NTON = 40, 52, 60 or 70) CONFIGURATIONS. PRESENT FOR W (NTON = 80, 90, 100, 110, 120 or 130) CONFIGURATION WHEN LINE VOLTAGE IS (VOLT = 575).

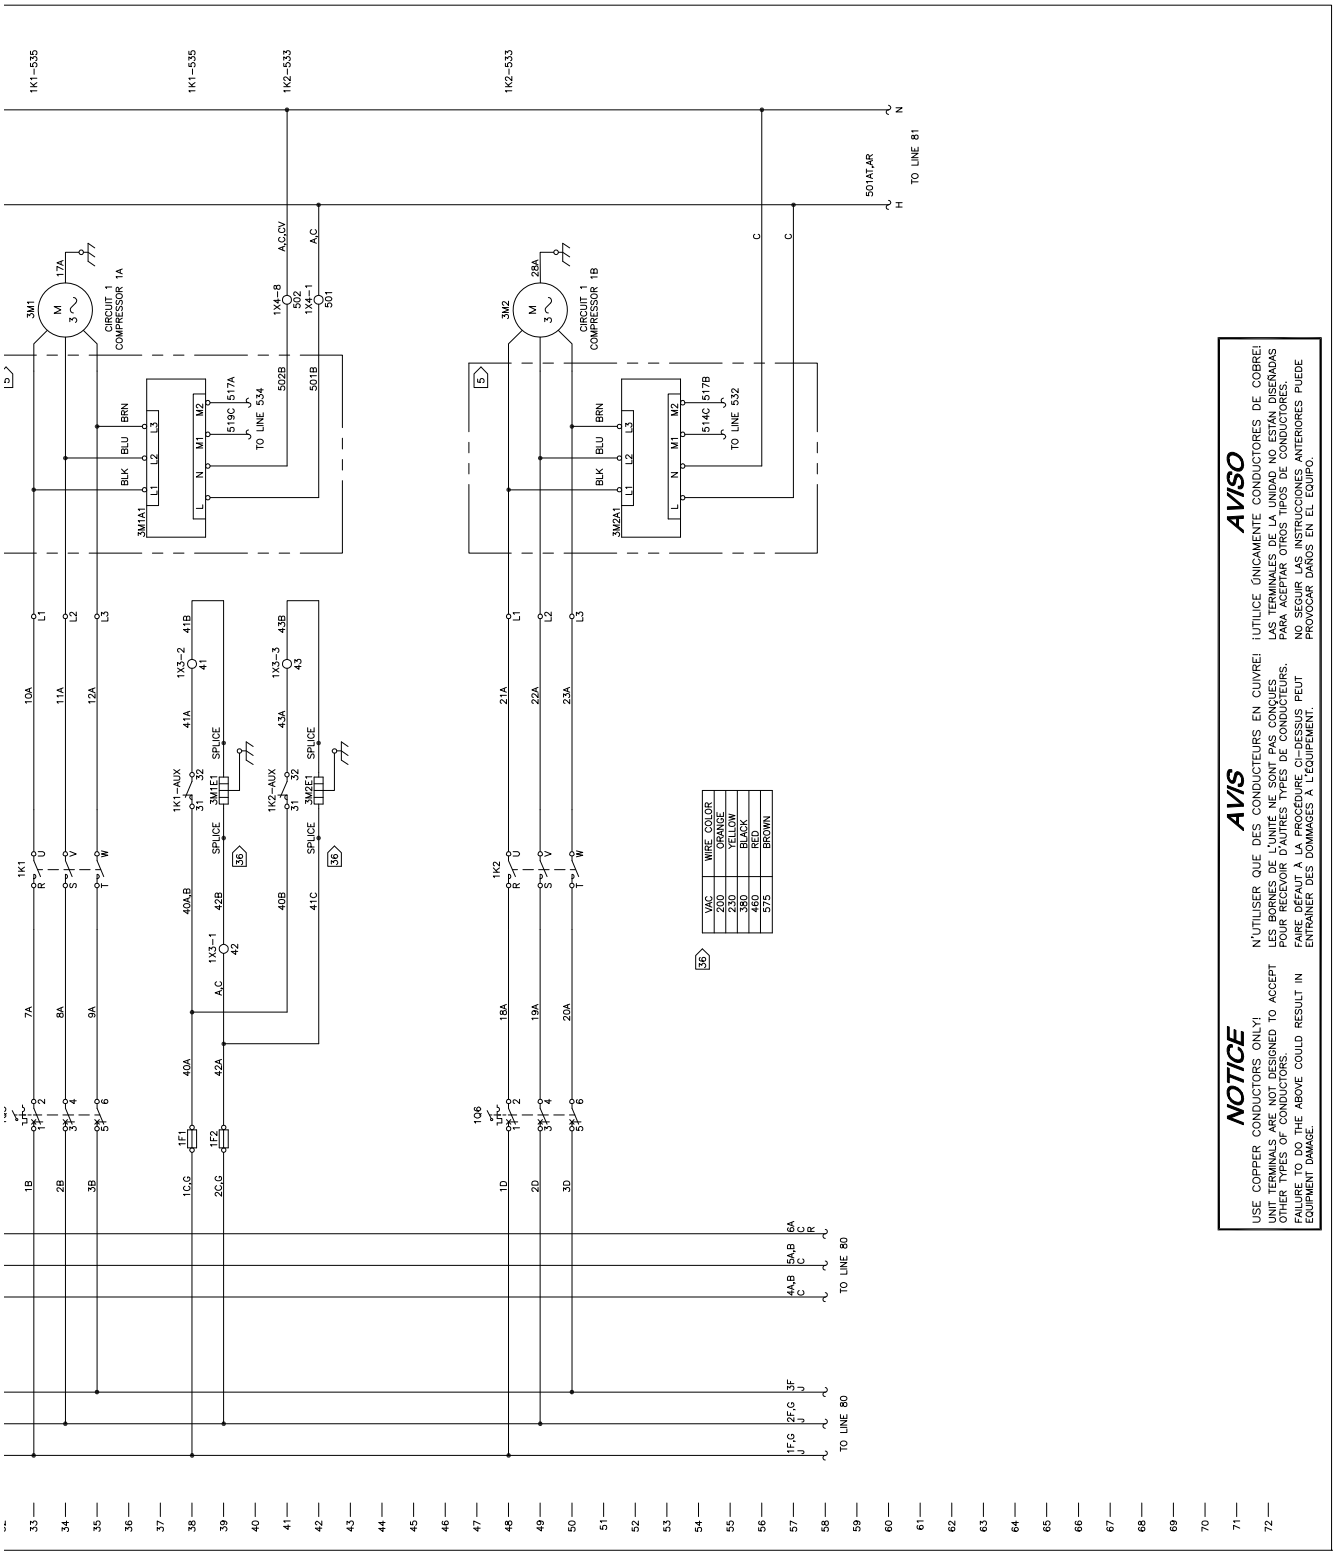
47 VENTILATION FAN PRESENT WHEN LINE (VOLT = 200, 230VAC, 380 or 400).

50 1A41, BACNET INTERFACE MODULE USED WHEN (COMM = BCNT).

51 THERMOSTAT FOR VSD HEATER BLANKETS. USED WHEN FAN VSD IS PRESENT (UAPP=LATC OR WIDC)

40-70 Ton - "V Frame" - Compressor Power





NOTICE
USE COPPER CONDUCTORS ONLY!
UNIT TERMINALS ARE NOT DESIGNED TO ACCEPT OTHER TYPES OF CONDUCTORS.
FAILURE TO DO THE ABOVE COULD RESULT IN EQUIPMENT DAMAGE.
AVIS
N'UTILISER QUE DES CONDUCTEURS EN CUIVRE!
LES BORNES DE L'UNITÉ NE SONT PAS CONÇUES POUR RECEVOIR D'AUTRES TYPES DE CONDUCTEURS.
FAIRE DÉFAUT À LA PROCÉDURE CI–DESSUS PEUT ENTRAÎNER DES DOMMAGES À L'ÉQUIPEMENT.
AVISO
¡UTILICE ÚNICAMENTE CONDUCTORES DE COBRE!
LAS TERMINALES DE LA UNIDAD NO ESTÁN DISEÑADAS PARA ACEPTAR OTROS TIPOS DE CONDUCTORES.
NO SEGUIR LAS INSTRUCCIONES ANTERIORES PUEDE PROVOCAR DAÑOS EN EL EQUIPO.

WARNING
HAZARDOUS VOLTAGE!
DISCONNECT ALL ELECTRIC POWER INCLUDING REMOTE DISCONNECTS AND FOLLOW LOCK OUT AND TAG PROCEDURES BEFORE SERVICING. INSURE THAT ALL MOTOR CAPACITORS HAVE DISCHARGED STORED VOLTAGE. UNITS WITH VARIABLE SPEED DRIVE REFER TO DRIVE INSTRUCTIONS FOR CAPACITOR DISCHARGE.
FAILURE TO DO THE ABOVE COULD RESULT IN DEATH OR SERIOUS INJURY.
AVERTISSEMENT
TENSION DANGEREUSE!
COUPER TOUTES LES TENSIONS ET OUVRIR LES SECTIONNEURS À DISTANCE, PUIS SUIVRE LES PROCÉDURES DE VERROUILLAGE ET D'ÉTIQUETTES AVANT TOUTE INTERVENTION. VÉRIFIER QUE TOUS LES CONDENSATEURS DES MOTEURS SONT DÉCHARGÉS. DANS LE CAS D'UNITÉS COMPORTANT DES ENTRAÎNEMENTS À VITESSE VARIABLE, SE REPORTER AUX INSTRUCTIONS DE L'ENTRAÎNEMENT POUR DÉCHARGER LES CONDENSATEURS.
NE PAS RESPECTER CES MESURES DE PRÉCAUTION PEUT ENTRAÎNER DES BLESSURES GRAVES POUVANT ÊTRE MORTELLES.
ADVERTENCIA
¡VOLTAJE PELIGROSO!
DESCONECTE TODA LA ENERGÍA ELÉCTRICA, INCLUSO LAS DESCONEXIONES REMOTAS Y SIGA LOS PROCEDIMIENTOS DE CIERRE Y ETIQUETADO ANTES DE PROCEDER AL SERVICIO. ASEGÚRESE DE QUE TODOS LOS CAPACITORES DEL MOTOR HAYAN DESCARGADO EL VOLTAJE ALMACENADO. PARA LAS UNIDADES CON ACCIONAMIENTO DE VELOCIDAD VARIABLE, CONSULTE LAS INSTRUCCIONES PARA LA DESCARGA DEL CONDENSADOR.
EL NO REALIZAR LO ANTERIORMENTE INDICADO, PODRÍA OCASIONAR LA MUERTE O SERIAS LESIONES PERSONALES.

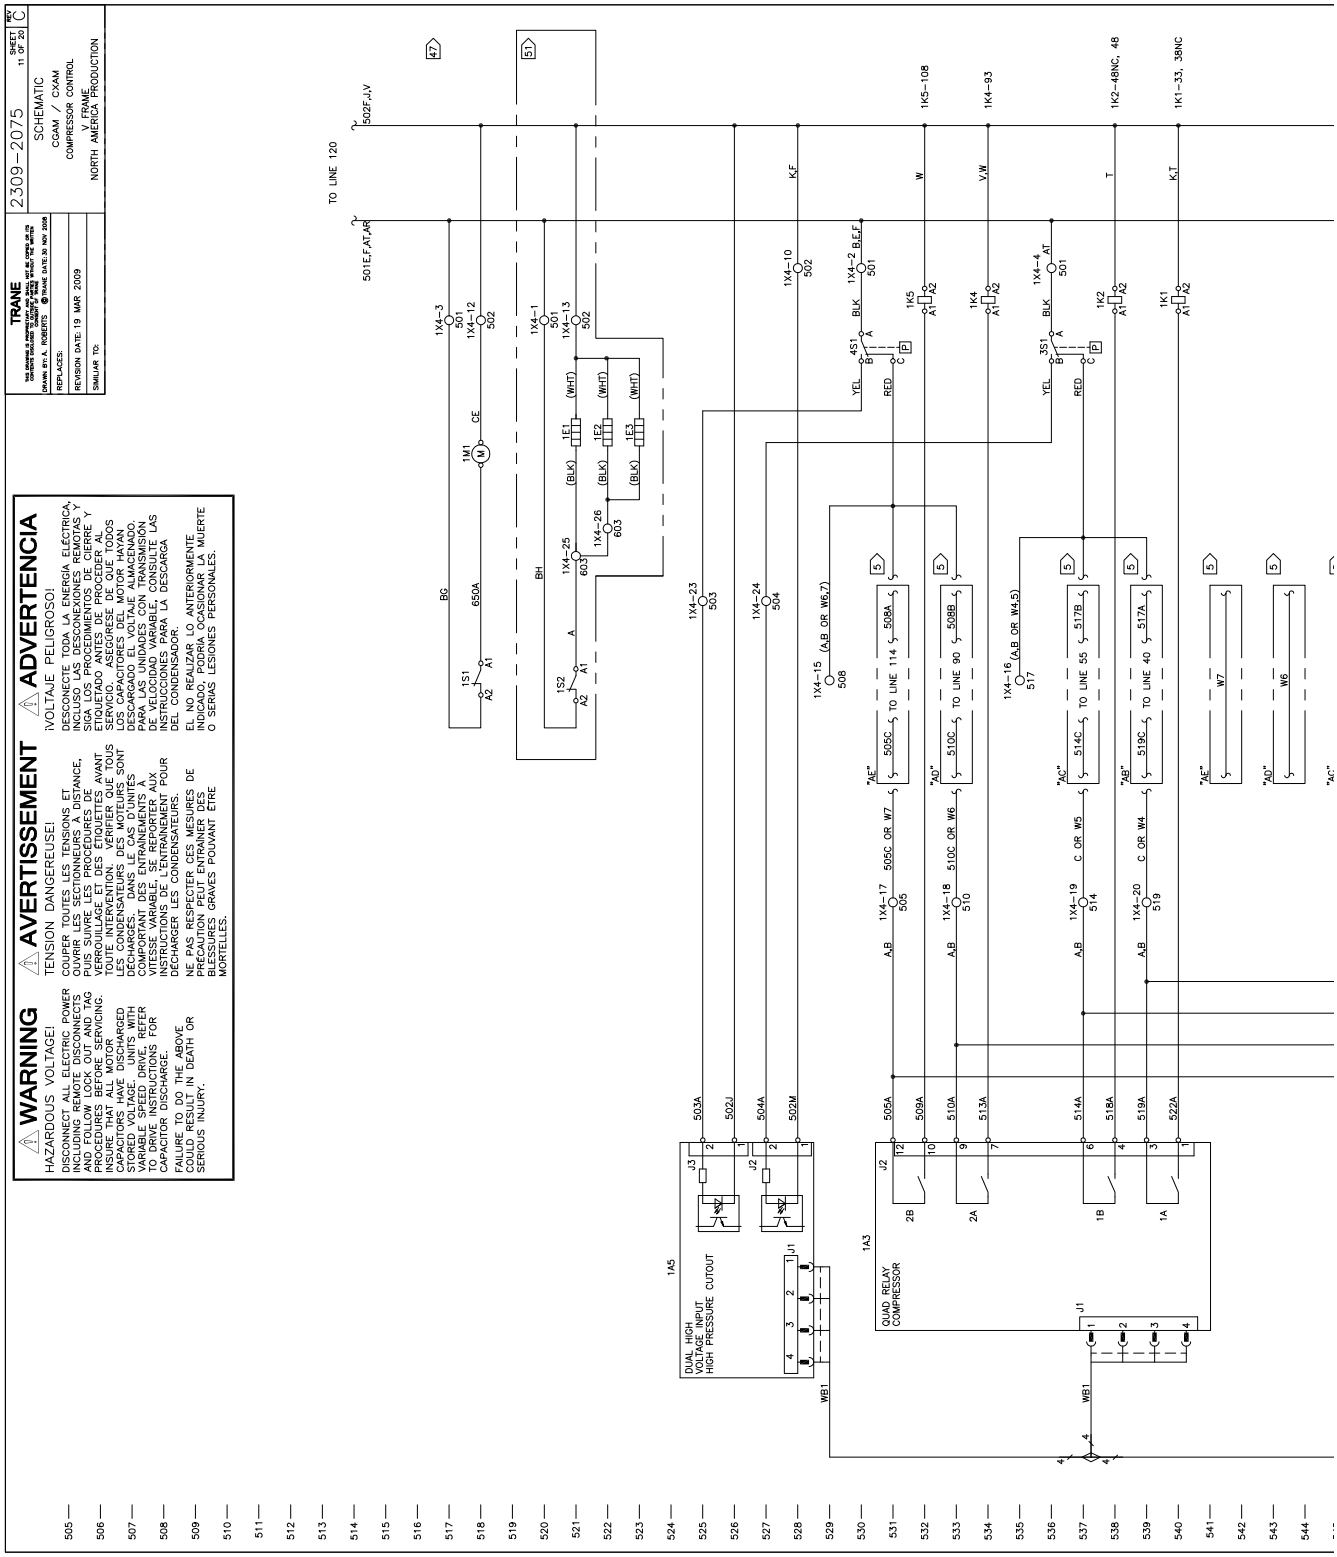
NOTICE
TRANE PUMP CONTROL MUST BE USED TO PROVIDE PUMP CONTROL. CHILLED WATER PUMP MUST BE CONTROLLED BY THE CHILLER OUTPUT.
FAILURE TO COMPLY WITH THIS REQUIREMENT COULD RESULT IN DAMAGE TO THE UNIT.
NOTICE
USE COPPER CONDUCTORS ONLY!
UNIT TERMINALS ARE NOT DESIGNED TO ACCEPT OTHER TYPES OF CONDUCTORS.
FAILURE TO DO THE ABOVE COULD RESULT IN EQUIPMENT DAMAGE.
AVIS
N'UTILISER QUE DES CONDUCTEURS EN CUIVRE!
LES BORNES DE L'UNITÉ NE SONT PAS CONÇUES POUR RECEVOIR D'AUTRES TYPES DE CONDUCTEURS.
FAIRE DÉFAUT À LA PROCÉDURE CI-DESSUS PEUT ENTRAÎNER DES DOMMAGES À L'ÉQUIPEMENT.
AVISO
¡UTILICE ÚNICAMENTE CONDUCTORES DE COBRE!
LAS TERMINALES DE LA UNIDAD NO ESTÁN DISEÑADAS PARA ACEPTAR OTROS TIPOS DE CONDUCTORES.
NO SEGUIR LAS INSTRUCCIONES ANTERIORES PUEDE PROVOCAR DAÑOS EN EL EQUIPO.



WARNING
HAZARDOUS VOLTAGE!
DISCONNECT ALL ELECTRIC POWER INCLUDING REMOTE DISCONNECTS AND FOLLOW LOCK OUT AND TAG PROCEDURES BEFORE SERVICING. AVOID CONTACT WITH TUBING AS CAPACITORS HAVE DISCHARGED STORED VOLTAGE. UNITS WITH VARIABLE SPEED DRIVE, REFER TO DRIVE INSTRUCTIONS FOR CAPACITOR DISCHARGE.
FAILURE TO DO THE ABOVE, COULD RESULT IN DEATH OR SERIOUS INJURY.
AVERTISSEMENT
TENSION DANGEREUSE!
COUPER TOUTES LES TENSIONS ET OUVRIR LES SECTIONNEURS À DISTANCE, PUIS SUIVRE LES PROCÉDURES DE VERROUILLAGE ET DES ÉTIQUETES AVANT TOUTE INTERVENTION. NOTEZ QUE TOUS LES CONDENSATEURS DES MOTEURS SONT DÉCHARGES, DANS LE CAS D'UNITÉS COMPORTANT DES ENTRAINEMENTS À VITESSE VARIABLE, SE REPORTER AUX INSTRUCTIONS DE L'ENTRAINEMENT POUR DÉCHARGER LES CONDENSATEURS.
NE PAS RESPECTER CES MESURES DE PRÉCAUTION PEUT ENTRAINER DES BLESSURES GRAVES POUVANT ÉTRE MORTELLES.
ADVERTENCIA
¡VOLTAJE PELIGROSO!
DESCONECTE TODA LA ENERGÍA ELÉCTRICA, INCLUSO LAS DESCONEXIONES REMOTAS Y SIGA LOS PROCEDIMIENTOS DE CIERRE Y ETIQUETADO ANTES DE PROCEDER AL SERVICIO. OBSERVE QUE TODOS LOS CAPACITORES DEL MOTOR HAYAN DESCARGADO EL VOLTAJE ALMACENADO. PARA LAS UNIDADES CON TRANSMISIÓN DE FRECUENCIA VARIABLE, CONSULTE LAS INSTRUCCIONES PARA LA DESCARGA DEL CONDENSADOR.
EL NO REALIZAR LO ANTERIORMENTE INDICADO, PODRÍA OCASIONAR LA MUERTE O SERIAS LESIONES PERSONALES.

ADVERTENCIA
¡VOLTAJE PELIGROSO!
DESCONECTE TODA LA ENERGÍA ELÉCTRICA, INCLUSO LAS DESCONEXIONES REMOTAS Y SIGA LOS PROCEDIMIENTOS DE CIERRE Y ETIQUETADO ANTES DE PROCEDER AL SERVICIO. ASEGÚRESE DE QUE TODOS LOS CAPACITORES DEL MOTOR HAYAN DESCARGADO EL VOLTAJE ALMACENADO. PARA LAS UNIDADES CON TRANSMISIONES DE VELOCIDAD VARIABLE, CONSULTE LAS INSTRUCCIONES PARA LA DESCARGA DEL CONDENSADOR.
EL NO REALIZAR LO ANTERIORMENTE INDICADO, PODRÍA OCASIONAR LA MUERTE O SERIAS LESIONES PERSONALES.

NOTICE

USE COPPER CONDUCTORS ONLY!
UNIT TERMINALS ARE NOT DESIGNED TO ACCEPT OTHER TYPES OF CONDUCTORS.
FAILURE TO DO THE ABOVE COULD RESULT IN EQUIPMENT DAMAGE.

AVIS

N'UTILISER QUE DES CONDUCTEURS EN CUIVRE!
LES BORNES DE L'UNITÉ NE SONT PAS CONÇUES POUR RECEVOIR D'AUTRES TYPES DE CONDUCTEURS.
FAIRE DÉFAUT À LA PROCÉDURE CI-DESSUS PEUT ENTRAÎNER DES DOMMAGES À L'ÉQUIPEMENT.

AVISO

¡UTILICE ÚNICAMENTE CONDUCTORES DE COBRE!
LAS TERMINALES DE LA UNIDAD NO ESTÁN DISEÑADAS PARA ACEPTAR OTROS TIPOS DE CONDUCTORES.
NO SEGUIR LAS INSTRUCCIONES ANTERIORES PUEDE PROVOCAR DAÑOS EN EL EQUIPO.

80-120 Ton - "W Frame" - Notes

TRANE THIS DRAWING IS PROPRIETARY AND SHALL NOT BE COPIED OR ITS CONTENTS DISCLOSED TO OUTSIDE PARTIES WITHOUT THE WRITTEN CONSENT OF TRANE DRAWN BY: A ROBERTS ©TRANE DATE: 30 NOV 2008	2309–2075	SHEET 3 OF 20	REV C
REPLACES:	SCHEMATIC CGAM / CXAM NOTES W FRAME NORTH AMERICA PRODUCTION		
REVISION DATE: 19 MAR 2009			
SIMILIAR TO:			

GENERAL NOTES:

1. UNLESS OTHERWISE NOTED, ALL SWITCHES ARE SHOWN AT 25°C (77F), AT ATMOSPHERIC PRESSURE, AT 50% RELATIVE HUMIDITY, WITH ALL UTILITIES TURNED OFF, AND AFTER A NORMAL SHUTDOWN HAS OCCURRED.
2. DASHED LINES INDICATE RECOMMENDED FIELD WIRING BY OTHERS. DASHED LINE ENCLOSURES AND/OR DASHED DEVICE OUTLINES INDICATE COMPONENTS PROVIDED BY THE FIELD. PHANTOM LINE ENCLOSURES INDICATE ALTERNATE CIRCUITRY OR AVAILABLE SALES OPTIONS. SOLID LINE INDICATES WIRING BY TRANE.
3. NUMBERS ALONG THE RIGHT SIDE OF THE SCHEMATIC DESIGNATE THE LOCATION OF CONTACTS BY LINE NUMBER. AN UNDERLINED NUMBER INDICATES A NORMALLY CLOSED CONTACT.
4. ALL FIELD WIRING MUST BE IN ACCORDANCE WITH THE NATIONAL ELECTRIC CODE (NEC), STATE AND LOCAL REQUIREMENTS.
5. CLASS 1 FIELD WIRING INSULATION RATING IS REQUIRED TO BE EQUAL TO OR GREATER THAN THE EQUIPMENT SUPPLY VOLTAGE RATING. CLASS 2 FIELD WIRE INSULATION TO BE RATED AT 300V MINIMUM.

FLAG NOTES:

1 ALL UNIT POWER WIRING MUST BE COPPER CONDUCTORS ONLY, HAVE A MINIMUM INSULATION TEMPERATURE RATING OF 90°C AND BE SELECTED AT 75°C RATINGS.

2 TERMINAL BLOCK(1X1/1X2) IS PROVIDED AS STANDARD ON ALL UNITS PNCO=TERM. CIRCUIT BREAKER(1Q1/1Q3) PNCO=CB AVAILABLE AS OPTION. TERMINAL BLOCK IS REPLACED WITH CIRCUIT BREAKER WHEN THIS OPTION IS SELECTED.

3 SINGLE SOURCE POWER IS PROVIDED AS STANDARD ON THESE PRODUCTS, DUAL SOURCE POWER IS OPTIONAL. FIELD CONNECTIONS FOR SINGLE SOURCE POWER ARE MADE TO 1X1, 1Q1, OR 1Q2. WHEN THE OPTIONAL DUAL SOURCE POWER IS SELECTED THE FIELD CONNECTIONS FOR CIRCUIT #2 ARE MADE TO 1X2, 1Q3, OR 1Q4.

5 ELECTRONIC PROTECTION MODULE USED FOR 15–30 TON COMPRESSORS ONLY. FOR 10–13TON COMPRESSOR CONTROL CIRCUIT, TERMINALS (16,19), (16,20) ARE JUMPED BY W4 AND W5. TERMINALS (15,18), (15,17) ARE JUMPED BY W6, AND W7 IN V CONFIGURATION. (NTON= 020, 026, 040 OR 052)

6 SINGLE SPEED FAN 1 PRESENT WHEN: STANDARD AMBIENT UNITS WITH 4 OR MORE FANS PER CIRCUIT, (NTON=100, 110, 120, OR 130) AND (UAPP=STDC OR HATC)

7 VSD AND ASSOCIATED CONTROL CIRCUITS ON FAN 1 PRESENT WHEN: LOW AMBIENT, AND WIDE AMBIENT UNITS. UNITS WITH PHR FAN CONTROL OPTION.

8 TWO SPEED FAN 1 PRESENT WHEN: STANDARD AMBIENT UNIT WITH TWO OR THREE FANS PER CIRCUIT, (NTON= 020, 026, 030, 035, 040, 052, 060, 070, 080, OR 090) AND (UAPP=STDC OR HATC)

9 REFER TO FAN CHART FOR VALID FAN CONFIGURATIONS.

10 TRANSFORMER FOR 575V UNITS ONLY. (VOLT=575) AND (UAPP=CATC OR WIDC)

14 OPTIONAL DUAL CUSTOMER SUPPLIED EVAP WATER PUMP(S). 6M2 WIRING PRESENT FOR DUAL PUMP CONFIGURATION ONLY. PUMP CONTROL CONFIGURATION SHOWS WIRING WITH CONTACTORS AND OVERLOAD RELAYS. PUMP(S) CAN ALSO BE POWERED BY CUSTOMER CONTROLLED VSD(S). PUMP STARTER FAULT SIGNAL(S) TO BE FIELD WIRED TO 1A12 (INSET "AX").

16 CUSTOMER SUPPLIED PUMP RUN SIGNAL TO BE FIELD WIRED TO 1A9.

17 WIRING FOR 200V/460V UNIT SHOWN. SEE INSET "B" FOR CONTROL POWER TRANSFORMER WIRING OF OTHER VOLTAGES.

18 CONTACT CLOSURE ENABLES ICE MAKING, WHEN ICE MAKING OPTION IS ORDERED. (EVLT=ICE)

21 CLASS 1 FIELD WIRED MODULE.

22 RELAY AT 120VAC: 7.2 AMPS RESISTIVE, 2.88 AMPS PILOT DUTY, 1/3 HP 7.2 FLA; AT 240VAC: 5 AMPS GENERAL PURPOSE.

23 FIELD ASSIGNED PROGRAMMABLE RELAYS. STAT=PRLY

14 OPTIONAL DUAL CUSTOMER SUPPLIED EVAP WATER PUMP(S). 6M2 WIRING PRESENT FOR DUAL PUMP CONFIGURATION ONLY. PUMP CONTROL CONFIGURATION SHOWS WIRING WITH CONTACTORS AND OVERLOAD RELAYS. PUMP(S) CAN ALSO BE POWERED BY CUSTOMER CONTROLLED VSD(S). PUMP STARTER FAULT SIGNAL(S) TO BE FIELD WIRED TO 1A12 (INSET "AX").

16 CUSTOMER SUPPLIED PUMP RUN SIGNAL TO BE FIELD WIRED TO 1A9.

17 WIRING FOR 200V/460V UNIT SHOWN. SEE INSET "B" FOR CONTROL POWER TRANSFORMER WIRING OF OTHER VOLTAGES.

18 CONTACT CLOSURE ENABLES ICE MAKING, WHEN ICE MAKING OPTION IS ORDERED. (EVLT=ICE)

21 CLASS 1 FIELD WIRED MODULE.

22 RELAY AT 120VAC: 7.2 AMPS RESISTIVE, 2.88 AMPS PILOT DUTY, 1/3 HP 7.2 FLA; AT 240VAC: 5 AMPS GENERAL PURPOSE.

23 FIELD ASSIGNED PROGRAMMABLE RELAYS. STAT=PRLY

24 CUSTOMER SUPPLIED POWER, 120V FOR NORTH AMERICA, 230V FOR ASIA AND PACIFIC RIM.

25 ONLY USED WHEN PUMP PACKAGE OPTION IS ORDERED. (PTYP=DSHP OR DHHP)

26 ONLY USED WHEN BUFFER TANK OPTION IS ORDERED. (BTNK=BTNK)

28 THE CONTACTS FOR AUTO STOP AND EMERGENCY STOP SWITCHES ARE JUMPERED AT THE FACTORY BY JUMPERS W2 & W3 TO ENABLE UNIT OPERATION. IF REMOTE CONTROL IS DESIRED, REMOVE THE JUMPERS AND CONNECT TO THE DESIRED CONTROL CIRCUIT.

30 PHASE PROTECTION RELAY USED ONLY FOR CIRCUIT(S) WITH 10 TON AND 13 TON COMPRESSORS (NTON = 20, 26, 40 or 52).

31 NOT PRESENT WHEN BOTH OF THE COMPRESSORS ARE LESS THAN 15 TON (NTON = 20, 26, 40 or 52).

32 GROUND SCREW IN MAIN CONTROL PANEL.

33 WHEN PUMP VSD IS PRESENT (PCON = VSD) PUMP CONTROL CONTACTORS (5K1/5K2) ARE INSIDE THE PUMP VSD AUXILIARY PANEL.

35 ONLY USED WHEN PARTIAL HEAT RECOVERY (CDHR = PRTF) OPTION IS ORDERED.

36 COMPRESSOR HEATER WIRE COLOR IS DETERMINED BY VOLTAGE IN CHART.

37 PRESENT ON "V" FRAME UNITS (NTON = 40, 52, 60 or 70).

38 PRESENT ON "W" FRAME UNITS (NTON = 80, 90, 100, 100, 120 or 130).

39 NOT PRESENT ON "W" FRAME UNITS, WITH 6 OR 8 FANS (NTON = 80, 90, 100, 110 or 120).

40 DISCHARGE REFIGERANT TEMPERATURE SENSOR PRESENT FOR ALL THE FOLLOWING OPTIONS: UNITS WITH ICEMAKING OPTION (EVLT = ICE), UNITS WITH LOW TEMPERATURE PROCESS COOLING (EVLT = PROC) , UNITS WITH PHR FAN CONTROL OPTION (CDHR = PRTF).

41 REFER TO FIELD WIRING DIAGRAM FOR SUGGESTED WIRING.

42 JUMPERS W10 AND W11 ARE INSTALLED BY THE FACTORY ON UNITS ORDERED WITH FIELD PROVIDED PUMPS (PTYP = NONE). JUMPERS W10 AND W11 ARE TO BE REMOVED WHEN PUMPS AND CONTROL ARE INSTALLED.

43 FUSES 1F38, 1F39, 1F40 PRESENT ON ALL SLANT (NTON = 20, 26, 30 or 35) AND V (NTON = 40, 52, 60 or 70) CONFIGURATIONS. PRESENT FOR W (NTON = 80, 90, 100, 110, 120 or 130)CONFIGURATION WHEN LINE VOLTAGE IS 575VAC (VOLT = 575).

44 FUSES 1F35, 1F36, 1F37 PRESENT ON W (NTON = 80, 90, 100, 110, 120 or 130) CONFIGURATIONS WHEN LINE VOLTAGE IS NOT 575VAC (VOLT = 200, 230, 380, 400 or 460).

45 FUSES 1F44, 1F45, 1F46 PRESENT ON ALL V (NTON = 40, 52, 60 or 70) CONFIGURATIONS. PRESENT FOR W (NTON = 80, 90, 100, 110, 120 or 130) CONFIGURATION WHEN LINE VOLTAGE IS (VOLT = 575).

46 FUSES 1F41, 1F42, 1F43 PRESENT ON W (NTON = 80, 90, 100, 110, 120 or 130) CONFIGURATIONS WHEN LINE VOLTAGE IS NOT 575VAC (VOLT = 200, 230, 380, 400 or 460).

47 VENTILATION FAN PRESENT WHEN LINE (VOLT = 200, 230VAC, 380 or 400).

50 1A41, BACNET INTERFACE MODULE USED WHEN (COMM = BCNT).

51 THERMOSTAT FOR VSD HEATER BLANKETS. USED WHEN FAN VSD IS PRESENT (UAPP=LATC OR WIDC)

NOTICE
USE COPPER CONDUCTORS ONLY!
UNIT TERMINALS ARE NOT DESIGNED TO ACCEPT OTHER TYPES OF CONDUCTORS.
FAILURE TO DO THE ABOVE COULD RESULT IN EQUIPMENT DAMAGE.
AVIS
N'UTILISER QUE DES CONDUCTEURS EN CUIVRE!
LES BORNES DE L'UNITÉ NE SONT PAS CONÇUES POUR RECEVOIR D'AUTRES TYPES DE CONDUCTEURS.
FAIRE DEFAUT À LA PROCEDURE CI-DESSUS PEUT ENTRAINER DES DOMMAGES À L'EQUIPEMENT.
AVISO
¡UTILICE ÚNICAMENTE CONDUCTORES DE COBRE!
LAS TERMINALES DE LA UNIDAD NO ESTAN DISEÑADAS PARA ACEPTAR OTROS TIPOS DE CONDUCTORES.
NO SEGUIR LAS INSTRUCCIONES ANTERIORES PUEDE PROVOCAR DAÑOS EN EL EQUIPO.

WARNING
HAZARDOUS VOLTAGE!
DISCONNECT ALL ELECTRIC POWER INCLUDING REMOTE DISCONNECTS AND FOLLOW LOCK OUT AND TAG PROCEDURES BEFORE SERVICING. INSURE THAT ALL MOTOR CAPACITORS HAVE DISCHARGED STORED VOLTAGE. UNITS WITH VARIABLE SPEED DRIVE, REFER TO DRIVE INSTRUCTIONS FOR CAPACITOR DISCHARGE.
FAILURE TO DO THE ABOVE, COULD RESULT IN DEATH OR SERIOUS INJURY.
AVERTISSEMENT
TENSION DANGEREUSE!
COUPER TOUTES LES TENSIONS ET OUVRIR LES SECTIONNEURS À DISTANCE, PUIS SUIVRE LES PROCÉDURES DE VERROUILLAGE ET D'ÉTIQUETAGE AVANT TOUTE INTERVENTION. VÉRIFIER QUE TOUS LES CONDENSATEURS DES MOTEURS SONT DÉCHARGÉS. DANS LE CAS D'UNITÉS COMPORTANT DES ENTRAÎNEMENTS À VITESSE VARIABLE, SE REPORTER AUX INSTRUCTIONS DE L'ENTRAÎNEMENT POUR DÉCHARGER LES CONDENSATEURS.
NE PAS RESPECTER CES MESURES DE PRÉCAUTION PEUT ENTRAÎNER DES BLESSURES GRAVES POUVANT ÊTRE MORTELLES.
ADVERTENCIA
¡VOLTAJE PELIGROSO!
DESCONECTE TODA LA ENERGÍA ELÉCTRICA, INCLUSO LAS DESCONEXIONES REMOTAS Y SIGA LOS PROCEDIMIENTOS DE CIERRE Y ETIQUETADO ANTES DE PROCEDER AL SERVICIO. ASEGÚRESE DE QUE TODOS LOS CAPACITORES DEL MOTOR HAYAN DESCARGADO EL VOLTAJE ALMACENADO. PARA LAS UNIDADES CON TRANSMISIÓN DE FRECUENCIA VARIABLE, CONSULTE LAS INSTRUCCIONES PARA LA DESCARGA DEL CONDENSADOR.
EL NO REALIZAR LO ANTERIORMENTE INDICADO, PODRÍA OCASIONAR LA MUERTE O SERIAS LESIONES PERSONALES.

Field Wiring Diagram - Notes

1. SINGLE SOURCE POWER IS PROVIDED AS STANDARD ON THESE PRODUCTS, DUAL SOURCE POWER IS OPTIONAL (PLIN=DUAL). FIELD CONNECTIONS FOR SINGLE (PLIN=SNGL) SOURCE POWER ARE MADE TO 1X1, OR 1Q2. WHEN THE OPTIONAL DUAL SOURCE POWER IS SELECTED THE FIELD CONNECTIONS FOR CIRCUIT #2 ARE MADE TO 1X2, OR 1Q4.
2. FOR VOLTAGES 200V/60HZ, 220V/50HZ, 380V/60HZ, 460V/60HZ, WIRE 26A SHALL BE CONNECTED TO H2. FOR VOLTAGES 230V/60HZ & 575V/60HZ, WIRE 26A SHALL BE CONNECT TO H3. 400V/50HZ UNIT IS FACTORY WIRED WITH 26A CONNECTED TO H3 – RECONNECT WIRE 26A TO H2 FOR 380V/50HZ, OR H4 FOR 415V/50HZ. H4 IS ONLY AVAILABLE WITH 400V/50HZ PANELS.
3. FIELD CONNECTIONS ARE ONLY MADE IN A CUSTOMER PROVIDED PUMP (PTYP=NONE). THESE CONNECTIONS WILL BE MADE BY THE FACTORY WHEN THE PUMP IS PROVIDED BY THE FACTORY (PTYP=DHHP).
4. CUSTOMER SUPPLIED POWER 115/60/1 OR 220/50/1 TO POWER RELAYS. MAX. FUSE SIZE IS 20 AMPS. GROUND ALL CUSTOMER SUPPLIED POWER SUPPLIES AS REQUIRED BY APPLICABLE CODES. GREEN GROUND SCREWS ARE PROVIDED IN UNIT CONTROL PANEL.
5. WIRED TO NEXT UNIT. 22 AWG SHIELDED COMMUNICATION WIRE EQUIVALENT TO HELIX LF22P0014216 RECOMMENDED. THE SUM TOTAL OF ALL INTERCONNECTED CABLE SEGMENTS NOT TO EXCEED 4500 FEET. CONNECTION TOPOLOGY SHOULD BE DAISY CHAIN. REFER TO BUILDING AUTOMATION SYSTEM (BAS) COMMUNICATION INSTALLATION LITERATURE FOR END OF LINE TERMINATION RESISTOR REQUIREMENTS.
6. WIRED TO TRACER OR OTHER TRANE REMOTE DEVICE. 22 AWG SHIELDED COMMUNICATION WIRE EQUIVALENT TO HELIX LF22P0014216 RECOMMENDED. THE SUM TOTAL OF ALL INTERCONNECTED CABLE SEGMENTS NOT TO EXCEED 4500 FEET. CONNECTION TOPOLOGY SHOULD BE DAISY CHAIN. REFER TO BUILDING AUTOMATION SYSTEM (BAS) COMMUNICATION INSTALLATION LITERATURE FOR END OF LINE TERMINATION RESISTOR REQUIREMENTS.
7. WIRED TO CUSTOMER CHILLED WATER SET POINT 2–10V OR 4–20mA.
8. WIRED TO CUSTOMER EXTERNAL DEMAND LIMIT 2–10V OR 4–20mA.
9. WIRED TO CUSTOMER 2–10V OR 4–20mA % CAPACITY ANNUNICIATOR.
11. REFER TO CGAM ELECTRICAL SCHEMATIC FOR SPECIFIC ELECTRICAL CONNECTION INFORMATION AND NOTES PERTAINING TO WIRING INSTALLATION.
12. ALL UNIT POWER WIRING MUST BE 600 VOLT COPPER CONDUCTORS ONLY AND HAVE A MINIMUM TEMPERATURE INSULATION RATING OF 90 DEGREE C. REFER TO UNIT NAMEPLATE FOR MINIMUM CIRCUIT AMPACITY AND MAXIMUM OVERCURRENT PROTECTION DEVICE. PROVIDE AN EQUIPMENT GROUND IN ACCORDANCE WITH APPLICABLE ELECTRIC CODES. REFER TO WIRE RANGE TABLE FOR LUG SIZES.
13. ALL FIELD WIRING MUST BE IN ACCORDANCE WITH NATIONAL ELECTRIC CODE AND LOCAL REQUIREMENTS.
14. ALL CUSTOMER CONTROL CIRCUIT WIRING MUST BE COPPER CONDUCTORS ONLY AND HAVE A MINIMUM INSULATION RATING OF 300 VOLTS. EXCEPT AS NOTED, ALL CUSTOMER WIRING CONNECTIONS ARE MADE TO CIRCUIT BOARD MOUNTED BOX LUGS WITH A WIRE RANGE OF 14 TO 18 AWG OR DIN RAIL MOUNTED SPRING FORCE TERMINALS.
15. UNIT PROVIDED DRY CONTACTS FOR THE CONDENSER/CHILLED WATER PUMP CONTROL. RELAYS ARE RATED FOR 7.2 AMPS RESISTIVE, 2.88 AMPS PILOT DUTY, OR ⅓ HP, 7.2 FLA AT 120 VOLTS 60 HZ, CONTACTS ARE RATED FOR 5 AMPS GENERAL PURPOSE DUTY 240 VOLTS.
16. CUSTOMER SUPPLIED CONTACTS FOR ALL LOW VOLTAGE CONNECTIONS MUST BE COMPATABLE WITH DRY CIRCUIT 24 VOLTS DC FOR A 12 mA RESISTIVE LOAD. SILVER OR GOLD PLATED CONTACTS RECOMMENDED.
17. FIELD CONNECTIONS ARE ONLY MADE IN A CUSTOMER PROVIDED PUMP. THESE CONNECTIONS WILL BE MADE BY THE FACTORY WHEN THE PUMP IS PROVIDED BY THE FACTORY. CUSTOMER SUPPLIED POWER 115V, 60Hz, 1PH.
18. CUSTOMER SUPPLIED 3 PHASE POWER.
19. OPTIONAL FIELD ASSIGNED PROGRAMMABLE RELAYS (STAT=PRLY). CLASS 1 FIELD WIRED MODULE, RELAY AT 120V: 7.2A RESISTIVE 2.88A PILOT DUTY, 1/2HP 7.2FLA; AT 240VAC: 5 AMPS GENERAL PURPOSE.
20. WIRED TO CUSTOMER 0–10 VDC PUMP SPEED SIGNAL.
21. WHEN FACTORY PROVIDED PUMP IS NOT SELECTED. CUSTOMER MUST SUPPLY SUITABLE PUMP SYSTEM. REFER TO PUMP MANUFACTURER FOR WIRING REQUIREMENTS.
22. THE CONTACTS FOR AUTO STOP AND EMERGENCY STOP SWITCHES ARE JUMPERED AT THE FACTORY BY JUMPERS W2 & W3 TO ENABLE UNIT OPERATION. IF REMOTE CONTROL IS DESIRED, REMOVED THE JUMPERS AND CONNECT TO THE DESIRED CONTROL CIRCUIT.
23. 1A15, LCI MODULE USED WHEN (COMM = LCI).
24. 1A41, BACNET INTERFACE MODULE USED WHEN (COMM = BCNT).
